**Theoretical and Computational Aerodynamics** Tapan K. Sengupta, 2014-10-20 Aerodynamics has seen many developments due to the growth of scientific computing which has caused the design cycle time of aerospace vehicles to be heavily reduced. Today computational aerodynamics appears in the preliminary step of a new design relegating costly time consuming wind tunnel testing to the final stages of design. Theoretical and Computational Aerodynamics is aimed to be a comprehensive textbook covering classical aerodynamic theories and recent applications made possible by computational aerodynamics. It starts with a discussion on lift and drag from an overall dynamical approach and after stating the governing Navier Stokes equation covers potential flows and panel method. Low aspect ratio and delta wings including vortex breakdown are also discussed in detail and after introducing boundary layer theory computational aerodynamics is covered for DNS and LES. Other topics covered are on flow transition to analyse NLF airfoils bypass transition streamwise and cross flow instability over swept wings viscous transonic flow over airfoils low Reynolds number aerodynamics high lift devices and flow control. Key features: Blends classical theories of incompressible aerodynamics to panel methods. Covers lifting surface theories and low aspect ratio wing and wing body aerodynamics. Presents computational aerodynamics from first principles for incompressible and compressible flows. Covers unsteady and low Reynolds number aerodynamics. Includes an up to date account of DNS of airfoil aerodynamics including flow transition for NLF airfoils. Contains chapter problems and illustrative examples. Accompanied by a website hosting problems and a solution manual. Theoretical and Computational Aerodynamics is an ideal textbook for undergraduate and graduate students and is also aimed to be a useful resource book on aerodynamics for researchers and practitioners in the research labs and the industry.

**Aerospace Propulsion Systems** Thomas A. Ward, 2010-05-17 Aerospace Propulsion Systems is a unique book focusing on each type of propulsion system commonly used in aerospace vehicles today: rockets, piston aero engines, gas turbine engines, ramjets and scramjets. Dr Thomas A Ward introduces each system in detail imparting an understanding of basic engineering principles describing key functionality mechanisms used in past and modern designs and provides guidelines for student design projects. With a balance of theory, fundamental performance analysis and design, the book is specifically targeted to students or professionals who are new to the field and is arranged in an intuitive systematic format to enhance learning. Covers all engine types including piston aero engines. Design principles presented in historical order for progressive understanding. Focuses on major elements to avoid overwhelming or confusing readers. Presents example systems from the US, the UK, Germany, Russia, Europe, China, Japan and India. Richly illustrated with detailed photographs. Cartoon panels present the subject in an interesting easy to understand way. Contains carefully constructed problems with a solution manual available to the educator. Lecture slides and additional problem sets for instructor use. Advanced undergraduate students, graduate students and engineering professionals new to the area of propulsion will find Aerospace Propulsion Systems a highly accessible guide to grasping the key essentials.
