

Digital tools, complex projects and playful engineering

Catelijn Coopmans and Jennifer Whyte of Imperial College London explain their project to investigate how software visualisation tools enable innovation

The increasingly widespread use of software tools for visualisation, simulation and prototyping is changing the way complex projects are conceptualised and delivered. Our ongoing research project, *Playful Engineering*, investigates how such tools enable innovation and how they find their place in organisational practice.

The project is conducted in collaboration with a number of engineering and business-based organisations and carried out within the Innovation Research Centre at Imperial Business School, Imperial College London.

"We build on a history of work investigating the role of advanced visualisation, simulation and prototyping tools in the construction sector", explains our engineering projects, such as the *Weather Forecast Airport Expansion* and the *Channel Tunnel Rail Link*, continue to be central to the project, but we consider how alongside other environments where digital tools play a role in generating business value.

In addition to those in digital environments in airport construction, oil and gas exploration/extraction and pharmaceutical/drug discovery, we are conducting a number of semi-structured interviews across various industrial sectors.

The research behind *Playful Engineering* comes from the premise

that innovation that emerges organically or "bottom up" is essential for achieving high quality solutions and improved business performance, and that such "play" can be facilitated by digital tools". Digital tools can help engineers and scientists produce the most useful outcomes of a range of alternative solutions and compare those relatively quickly and comparatively. This is especially relevant where multiple, potentially contradictory requirements come into play. For example, design work on the Greater London Assembly building and the Florence TAD Stadium involved visualisation of light, acoustics and movement flow visualisations to find the best way of combining striking architectural design with appropriate performance in terms of safety and quality of use.

Such visualisations serve a "transparent" as well as "communicative" function when used in the interaction with clients, regulators and other stakeholders. Virtual multidisciplinary or interdisciplinary engagement, because the engaging stakeholders are connected remotely to the project process.

Finally, digital tools can be used to explore the processes through which work is delivered. Digital data science and data mining algorithms form the basis for the creation of this type of visual models or simulations.

In the construction industry, visual modelling perhaps that takes into

account multiple elements of information can test various construction strategies. In the context of complex projects with many interdependencies, such as the *Weather Forecast 2*, the integration quality of digital tools is especially relevant. Whether visualisations apply to complex projects for other sectors, such as the discovery of new molecules in the pharmaceutical industry and the production optimisation of oil and gas wells.

Enabling innovation

Playful Engineering aims to add to the understanding of how visualisations, simulation and prototyping enable innovation by providing the first insights into the organisational role of the story. We seek to do this by organisations to gain strategic benefits from the use of digital tools. In what direct and indirect ways are positive effects encouraged or discouraged those taking and making decisions? What are the learning challenges for those that need to use digital tools to enhance innovation? The findings so far are off technology in practice, our work offers a detailed understanding of how digital tools help bring about change in culture and engineering-oriented business. Our approach involves interviewing, observational fieldwork and discussion analysis in order to develop a rich, open-ended understanding of the way in which digital tools are used to work in our collaborating organisations. The research is designed to identify generic problems and solutions across diverse contexts of use.

We are now in the final stages of data collection and will undertake with the analysis of data from our digital tools. The analysis is ongoing around two themes, which we identified through background work.

Researching the use of digital tools

This theme considers how the creation of visual models, simulations and prototypes is connected and how digital visualisations are not up and running. In complex projects the possibilities for integrating data and modelling processes are potentially endless, but resources are limited. What matters in specifying how plans and means in which digital visualisation can add the most value through enhancing understanding of various

Tools For Complex Projects:

Tools for Complex Projects Dr Julien Pollack, Dr Kaye Remington, 2012-09-28 Traditional project management approaches assume that project contexts are unchanging and key factors though complicated are reducible to unambiguous elements for management and control. Whilst this assumption has simplified the task for writers and educators it is increasingly being recognised that these techniques do not work in projects which may be described as complex due to their size, technical difficulties, conflicting environmental and political constraints or poorly understood or shared goals. **Tools for Complex Projects** draws on research in the areas of project management complexity theory and systems thinking to provide a ready reference for understanding and managing the increasing complexity of projects and programmes. The main part of the book provides a series of fourteen project tools. Some of these tools may be used at the level of the whole project life cycle. Others may be applied ad hoc at any time. In each case the authors provide detailed guidelines for using the tool, information on its purpose and the types of complexity for which it is most appropriate, the theoretical background to the tool, a practical example of its use and any necessary words of caution. This is an example of advanced project management at work: sophisticated tools that require a level of project and management expertise and offer rigorous and highly practical methods for understanding, structuring and managing the most complex of projects.
