Introduction: Basics of WHCP

Basics of Wellhead Control Panel (WHCP) is a critical component of a wellhead system.

100

WHCP: Overview & Components

WHCPs are the central control units for wellhead systems, managing the flow of fluids (oil, gas, water) and pressure. They are typically located near the wellhead and are connected to the wellbore via a control line. WHCPs are responsible for monitoring the wellhead pressure, temperature, and flow rate, and for controlling the wellhead valves. They also provide a means for the operator to monitor the wellhead system and to adjust the wellhead pressure and flow rate as needed. WHCPs are typically equipped with a control panel, a control line, and a control valve. The control panel is used to monitor the wellhead pressure, temperature, and flow rate, and to adjust the wellhead pressure and flow rate as needed. The control line is used to transmit signals between the control panel and the control valve. The control valve is used to control the flow of fluids through the wellhead.

WHCPs are typically designed to be rugged and reliable, and to be able to operate in harsh environments.
