Chemistry of the Platinum Group Metals F.R. Hartley,1991-08-30 The chemistry of platinum group metals is a rapidly expanding commercially important field It is dominated by the catalytic properties of the metals They are useful in petrochemical and general chemical plants and are becoming increasingly important as autocatalysts for pollution control The book covers recent developments in the chemistry of the six platinum group metals namely platinum palladium rhodium iridium ruthenium and osmium The material falls into three broad areas Firstly the occurrence extraction and use of the metals especially in catalysis electrochemistry energy and electronics Secondly organometallic and homogeneous catalytic chemistry and last but not least coordination chemistry including biochemistry and cancer therapy The work is aimed at scientists in universities and in industry using any of the six platinum group metals in research It will be useful for those studying the compounds of the metals themselves and those considering to use either the metals or their complexes and catalysts in their experimental work

BioMEMS and Bionanotechnology Ronald P. Manginell,2002 Microelectromechanical systems MEMS can be a critical link between the macroworld and the realm of nanobiotechnology Top down MEMS methods and devices will likely serve as an important handle for interfacing with the bottom up techniques and structures that typify nanobiotechnology This volume focuses on recent advances in the fields of MEMS and BioMEMS including microfluidics bioanalysis packaging materials and fabrication methods It is clear from these presentations that top down semiconductor based processing remains vital Indeed frontiers are expanding within this realm with new research on materials like poly SiGe However new materials particularly polymers and bottom up methods such as soft lithography and chemical synthesis are continually gaining in utility and importance It is also apparent from this volume that microanalytical techniques continue to be advanced including new ways of separating samples by optical adhesion based and dielectrophoretic methods And sensors

always of interest are demonstrated here by research into sensors for environmental and material analysis Capacitance based sensors for DNA analysis and magnetic sensors for position sensing are also highlighted Finally systems for direct interfacing with biological systems are addressed with presentations on neural recording methods retinal implants and tissue engineering
