The Th2 Type Immune Response in Health and Disease William C. Gause, David Artis, 2015-12-08 The type 2 immune response that develops during infectious disease has undergone major paradigm shifts in the last several years as new cell types and pathways have been identified. It is now clear that the type 2 immune response, characterized by elevations in specific cytokines including IL 4, IL 5, and IL 13, is associated with helminth infections in both humans and mice. This response is complex and includes effector functions that mediate resistance contributing to expulsion and in some cases destruction of the parasite. But just as importantly, the type 2 immune response can also mediate tolerance mechanisms which can mitigate tissue injury as these large multicellular parasites transit through vital organs. The tolerance mechanisms include both tissue repair and immune regulatory effects. These latter aspects of the helminth-induced type 2 immune response are increasingly recognized as a potential resource that can be mined for the development of novel immunotherapies that may enhance wound healing, control of autoimmune and inflammatory diseases, and regulation of metabolic homeostasis. In this book, leading researchers in this exciting and dynamic field discuss the latest findings and emerging concepts, providing an intellectual framework that can be used as a basis for new discoveries and potentially new treatments for diseases associated with inflammation.

Molecular Genetics of Inflammatory Bowel Disease Mauro D'Amato, John D Rioux, 2013-10-05 Research in Crohn's disease (CD) and ulcerative colitis (UC) together known as the inflammatory bowel diseases (IBD) has truly seen a revolution in the last 5-10 years. This book examines how these genetic discoveries have led to the identification of biological functions not previously associated with IBD pathophysiology, e.g., autophagy, how multiple genetic risk factors for IBD converge on given biological functions, and that together the identified variants in these genes have predisposing and protective roles, e.g., the multiple variants in the receptor for the IL23 cytokine and its signaling cascade, and how having such a large number of known genetic risk factors has changed our understanding, not only about the genetic and molecular overlap between CD and UC but also between these diseases and other chronic inflammatory diseases, e.g., psoriasis, multiple sclerosis, type 1 diabetes, and many others.
