birds and gliders which use the vertical motion of the air to maintain or gain height Since the 1880 s a time before manned gliding flight had been achieved the mechanism of dynamic soaring has been poorly explained by the Rayleigh cycle or the wind gradient theory However there is more to dynamic soaring than the wind gradient and furthermore the true nature of albatross flight has only recently been revealed by filming and GPS tracking Dynamic Soaring Dissected takes up the discussion where it was left in the 19th century and explains how aircraft and birds fly It looks at albatross flight through the lens of electronic tracking and takes us on a foraging trip with an albatross in long distance soaring flight In the Windward Turn Theory it describes the mechanism of dynamic soaring and the hidden effect of the wind on a bird or an aircraft in flight It explains the way that albatrosses are able to turn this effect to their advantage and how they are able to dynamic soar crosswind upwind and downwind It also describes how radio control gliders can achieve huge speeds in circling flight and settles the perennial debate on the Myth of the Downwind Turn and what really happens when an aircraft turns downwind and ends up in a stall and spin accident **Flying Magazine** ,1940-11 **Glider Flying Handbook** ,2003 FAA Aviation News ,1993 **Civil Air Regulations: Pilot rating** United States.
