Thermodynamics of Systems Containing Flexible-Chain Polymers V.J. Klenin, 1999-06-03 This book deals with the problems of the thermodynamics of systems containing flexible chain polymers as the basis of polymer material science The main thermodynamic quantities and concepts are introduced and discussed in the order of the objects getting more and more complicated gases magnets low molecular weight substances and mixtures and finally polymers and polymer blends All topics are considered in a common clue using the principle of universality. The stability conditions for the one phase state of multi component systems are given Phase separation is regarded as a result of loss in stability The critical state of a system with the one phase state being close to the boundary of stability conditions breaking is discussed in detail The effects of both light scattering elastic and dynamic and diffusion as directly depending on the thermodynamic parameters characterizing the one phase state stability are considered in detail One of the versions of colloid scattering namely the turbidity spectrum method is described as useful for the characterization of various heterogeneous structures and for the phase analysis of polymer systems In the approximation of mean field theories and advanced field theory formalisms expound the following divisions of the thermodynamics of binary and polynary systems with flexible chain polymers conformation of the polymer coil composition fluctuations elastic and dynamic light scattering diffusion in the one phase state including the critical range phase separation polymer fractionation the coil globule transition phase equilibrium and separation in the system network polymer low molecular weight liquid polymer blends and multiphase separation Cellulose Chemistry and Technology ,2001 Advanced Biomaterials--characterization, Tissue Engineering, and Complexity Polymer Science, 2004 Steven C. Moss, 2002 This proceedings volume is a compilation of papers from three symposia held at the 2001 MRS Fall Meeting in Boston Historically some of the most outstanding breakthroughs in the biological sciences have stemmed from the application of physical characterization techniques to the examination of biological materials and systems Excellent examples include the application of magnetic resonance imaging MRI to the examination of human tissues and the use of X ray diffraction to determine the structure of DNA Symposium FF Physical Characterization of Biological Materials and Systems draws together researchers from a diverse range of disciplines that are applying physical characterization techniques to the study of biological materials and systems The past decade has also seen an explosion in novel polymer synthetic and processing routes that allow control of tissue engineering scaffolds at the micro nano and even molecular levels These advanced techniques are enabling tissue engineers to synthesize scaffolds and templates that intimately regulate cell behavior Researchers from Symposium GG Polymeric Biomaterials for Tissue Engineering come together here to identify and elaborate upon the unifying themes in polymeric synthesis processing and characterization as specifically applied to tissue engineering research In Symposium HH Bioinspired Materials Moving Towards Complexity chemists physicists biologists and engineers join together to discuss the interdisciplinary development of synthetic materials based on concepts for materials
