

Turbo C User's Guide:

Embedded Assembly Language. Part I - Basic Principles

BASM.DOC is an online file that tells you how to use the Turbo C++ built-in inline assembler (BASM) to include assembly language routines in your C and C++ programs without any need for a separate assembler. Such assembly language routines are called inline assembly, because they are compiled right along with your C routines, rather than being assembled separately, then linked together with modules produced by the C compiler.

Turbo C++ lets you write assembly language code right inside your C and C++ programs. This is known as inline assembly and has certain restrictions.

- It cannot use assembler macros
- It cannot handle 80386 or 80486 instructions
- It does not permit Intel mode syntax
- It allows only a limited set of assembler directives

To invoke the in-line assembler, you need only use the keyword `asm` to introduce an inline assembly language instruction. The format is

```
asm opcode operands
```

where `opcode` is a valid 80x86 instruction, and `operands` contains the operand(s) acceptable to the opcode, and can reference C constants, variables, and labels.

To include a number of `asm` statements, surround them with braces. The initial brace must appear on the same line as the `asm` keyword.

Semicolons are not used to start comments (as they are in TASM). When commenting `asm` statements, use C-style comments, like this:

```
asm mov ax,ds,          /* This comment is OK */
asm (pop ax, pop ds, ret) /* This is legal too */
asm push ds             ,THIS COMMENT IS INVALID!!
```

The assembly language portion of the statement is copied straight to the output, embedded in the assembly language that Turbo C++ is generating from your C or C++ instructions. Any C symbols are replaced with ap-propriate assembly language equivalents.

Because the inline assembly facility is not a complete assembler, it may not accept some assembly language constructs. If this happens, Turbo C++ will issue an error message. You then have two choices. You can simplify your inline assembly language code so that the assembler will accept it, or you can use an external assembler such as TASM. However, TASM might not identify the location of errors, since the original C source line number is lost.
