Cognition Ann Dowker,Hans-Christoph Nuerk,2017-06-16 For many years an abstract amodal semantic magnitude representation largely independent of verbal linguistic representations has been viewed as the core numerical or mathematical representation This assumption has been substantially challenged in recent years Linguistic properties affect not only verbal representations of numbers but also numerical magnitude representation spatial magnitude representations calculation parity representation place value representation and even early number acquisition Thus we postulate that numerical and arithmetic processing are not fully independent of linguistic processing This is not to say that in patients magnitude processing cannot function independently of linguistic processing we just suppose these functions are connected in the functioning brain So far much research about linguistic influences on numerical cognition has simply demonstrated that language influences number without investigating the level at which a particular language influence operates After an

overview we present new findings on language influences on seven language levels

Conceptual Conceptual properties of language

Syntactic The grammatical structure of languages beyond the word level influences

Semantic The semantic meaning or existence of words

Lexical The lexical composition of words in particular number words

Visuo spatial orthographic Orthographic properties such as the writing reading direction of a language

Phonological Phonological phonetic properties of languages

Other language related skills Verbal working memory and other cognitive skills related to language representations

We hope that this book provides a new and structured overview on the exciting influences of linguistic processing on numerical cognition at almost all levels of language processing
