

13. ms/ μ s This defines the multiplication factor for the horizontal scale in timebase mode.
14. MAGN The horizontal scale units are to be multiplied by this setting in both timebase and xy modes. To avoid confusion, leave it at x1 unless you really need to change it.
15. Time/Div This selector controls the frequency at which the beam sweeps horizontally across the screen in timebase mode, as well as whether the oscilloscope is in timebase mode or xy (x VIA A) mode. This switch has the following positions:
 - a) X VIA A In this position, an external signal connected to input A is used in place of the internally generated ramp. (This is also known as xy mode.)
 - b) .5, 1, 2, 5, etc. Here the internally generated ramp voltage will repeat such that each large (cm) horizontal division corresponds to .5, 1, 2, 5, etc. ms. or μ s depending on the multiplier and magnitude settings.
16. The following controls are for triggering of the scope, and only have an effect in timebase mode.
17. A/B selector. This allows you to choose which signal to use for triggering.
18. -/+ will force the ramp signal to synchronise its starting time to either the decreasing or increasing part of the unknown signal you are studying.
19. INT/EXT This will determine whether the the ramp will be synchronised to the signal chosen by the A/B switch or by whatever signal is applied to the EXT. SYNC. input. (See 21 below.)
20. External trigger input.

MEASUREMENTS USING CRO

MEASUREMENT OF AMPLITUDE

1. Switch on the CRO. Obtain a sharply defined trace of a horizontal line on the screen by adjusting INTENS and FOCUS knobs.
2. Adjust the Y position knob so as to make coincide with the centre line on the screen by keeping the AC-DC switch in the ground position
3. Connect the function generator output to CRO using a test probe. Switch on the function generator.
4. Count the number of divisions spanned by the signal from peak to peak. Multiply this by the scale indicated by the VOLT/DIV knob. This gives the peak to peak amplitude of the signal. Half of this will give the maximum value of the voltage
5. Repeat the above steps for various settings of VOLT/DIV knob

MEASUREMENT OF FREQUENCY

1. Obtain a sharply defined trace of horizontal line on the screen by adjusting the INTENS and FOCUS knobs. Feed the signal whose frequency is to be measured, to either of the channels using a probe and observe the signal on CRO
2. Adjust the TIME/DIV knob so as to see two or three cycles of the waveform. Count the number of divisions in one cycle of the waveform. Multiply this by the time base setting. This gives the period of the signal.
3. Reciprocal of the period will give the frequency of the signal
4. Repeat the above steps for various settings of TIME/DIV
