Transputer Instruction Set INMOS Limited, 1988-01-01 Computer Systems Organization Computer System Implementation **Programming Language Implementation and Logic Programming** Pierre Deransart, Jan Maluszynski, 1990-08-08 This volume consists of the papers accepted for presentation at the second international workshop on Programming Language Implementation and Logic Programming PLILP 90 held in Linköping Sweden August 20-22 1990 The aim of the workshop was to identify concepts and techniques used both in implementation of programming languages regardless of the underlying programming paradigm and in logic programming The intention was to bring together researchers working in these fields The volume includes 26 selected papers falling into two categories Papers in the first category present certain ideas from the point of view of a particular class of programming languages or even a particular language The ideas presented seem to be applicable in other classes of languages Papers in the second category directly address the problem of integration of various programming paradigms The proceedings of the predecessor workshop PLILP 88 held in Orleans France May 16-18 1988 are available as Lecture Notes in Computer Science Vol 348 **The Transputer in Australasia** John Hulskamp, Terry Bossomaier, Tom Hintz, 1991 Covering recent developments involving transputer technology in the Australasian region this work contains 35 papers addressing transputer applications in communications networks fuzzy systems image processing and medical equipment *Modern Geometric Computing for Visualization* Toshiyasu L. Kunii, Yoshihisa Shinagawa, 2012-12-06 This volume is on modern geometric computing for visualization which is at the forefront of multi-disciplinary advanced research areas This area is attracting intensive research interest across many application fields singularity in cosmology turbulence in ocean engineering high energy physics molecular dynamics environmental problems modern mathematics computer graphics and pattern recognition Visualization requires the computation of displayable shapes which are becoming more and more complex in proportion to the complexity of the objects and phenomena visualized Fast computation requires information locality Attaining information locality is achieved through characterizing the shapes in geometry and topology and the large amount of computation required through the use of supercomputers This volume contains the initial results of our efforts to satisfy these requirements by inviting experts and selecting new research works through review processes To be more specific this book presents the proceedings of the International Workshop on Modern Geometric Computing for Visualization held at Kogakuin University Tokyo Japan June 29-30 1992 organized by the Computer Graphics Society Japan Personal Computer Software Association Kogakuin University and the Department of Information Science Faculty of Science The University of Tokyo We received extremely high quality papers for review from five different countries one from Australia one from Italy four from Japan one from Singapore and three from the United States and we accepted eight papers and rejected two Transputer Research and Applications, 2 John A. Board, 1990 Correct System Design Ernst-Rüdiger Olderog, Bernhard Steffen, 2003-06-26 Computers are gaining

more and more control over systems that we use or rely on in our daily lives privately as well as professionally In safety critical applications as well as in others it is of paramount importance that systems controlled by a computer or computing systems themselves reliably behave in accordance with the specification and requirements in other words here correctness of the system of its software and hardware is crucial In order to cope with this challenge software engineers and computer scientists need to understand the foundations of programming how different formal theories are linked together how compilers correctly translate high level programs into machine code and why transformations performed are justifiable This book presents 17 mutually reviewed invited papers organized in sections on methodology programming automation compilation and application *Massively Parallel Processing Applications and Development* L. Dekker,W. Smit,J.C. Zuidervart,2013-10-22 The contributions of a diverse selection of international hardware and software specialists are assimilated in this book s exploration of the development of massively parallel processing MPP The emphasis is placed on industrial applications and collaboration with users and suppliers from within the industrial community consolidates the scope of the publication From a practical point of view massively parallel data processing is a vital step to further innovation in all areas where large amounts of data must be processed in parallel or in a distributed manner e g fluid dynamics meteorology seismics molecular engineering image processing parallel data base processing MPP technology can make the speed of computation higher and substantially reduce the computational costs However to achieve these features the MPP software has to be developed further to create user friendly programming systems and to become transparent for present day computer software Application of novel electro optic components and devices is continuing and will be a key for much more general and powerful architectures Vanishing of communication hardware limitations will result in the elimination of programming bottlenecks in parallel data processing Standardization of the functional characteristics of a programming model of massively parallel computers will become established Then efficient programming environments can be developed The result will be a widespread use of massively parallel processing systems in many areas of application Towards Verified Systems J. Bowen,2013-10-22 As the complexity of embedded computer controlled systems increases the present industrial practice for their development gives cause for concern especially for safety critical applications where human lives are at stake The use of software in such systems has increased enormously in the last decade Formal methods based on firm mathematical foundations provide one means to help with reducing the risk of introducing errors during specification and development There is currently much interest in both academic and industrial circles concerning the issues involved but the techniques still need further investigation and promulgation to make their widespread use a reality This book presents results of research into techniques to aid the formal verification of mixed hardware software systems Aspects of system specification and verification from requirements down to the underlying hardware are addressed with particular regard to real time issues The work presented is largely based around the Occam programming language and Transputer

microprocessor paradigm The HOL theorem prover based on higher order logic has mainly been used in the application of machine checked proofs The book describes research work undertaken on the collaborative UK DTI SERC funded Information Engineering Dictorate Safemos project The partners were Inmos Ltd Cambridge SRI the Oxford University Computing Laboratory and the University of Cambridge Computer Laboratory who investigated the problems of formally verifying embedded systems The most important results of the project are presented in the form of a series of interrelated chapters by project members and associated personnel In addition overviews of two other ventures with similar objectives are included as appendices The material in this book is intended for computing science researchers and advanced industrial practitioners interested in the application of formal methods to real time safety critical systems at all levels of abstraction from requirements to hardware In addition material of a more general nature is presented which may be of interest to managers in charge of projects applying formal methods especially for safety critical systems and others who are considering their use

Mathematics of Program Construction Jan L.A. van de Snepscheut, 1989-06-07 The papers included in this volume were presented at the Conference on Mathematics of Program Construction held from June 26 to 30 1989 The conference was organized by the Department of Computing Science Groningen University The Netherlands at the occasion of the University's 375th anniversary The creative inspiration of the modern computer has led to the development of new mathematics the mathematics of program construction Initially concerned with the posterior verification of computer programs the mathematics have now matured to the point where they are actively being used for the discovery of elegant solutions to new programming problems Initially concerned specifically with imperative programming the application of mathematical methodologies is now established as an essential part of all programming paradigms functional logic and object oriented programming modularity and type structure etc Initially concerned with software only the mathematics are also finding fruit in hardware design so that the traditional boundaries between the two disciplines have become blurred The varieties of mathematics of program construction are wide ranging They include calculi for the specification of sequential and concurrent programs program transformation and analysis methodologies and formal inference systems for the construction and analysis of programs The mathematics of specification implementation and analysis have become indispensable tools for practical programming

Z User Workshop, York 1991 J. E. Nicholls, 2012-12-06 In ordinary mathematics an equation can be written down which is syntactically correct but for which no solution exists For example consider the equation $x \times 1$ defined over the real numbers there is no value of x which satisfies it Similarly it is possible to specify objects using the formal specification language Z 3 4 which can not possibly exist Such specifications are called inconsistent and can arise in a number of ways Example 1 The following Z specification of a function f from integers to integers $f : \mathbb{Z} \rightarrow \mathbb{Z}$ $f(x) = 1 \vee f(x) = 2$ is inconsistent because axiom i gives $f(0) = 1$ while axiom ii gives $f(0) = 2$ This contradicts the fact that f was declared as a function that is f must have a unique result when applied to an argument Hence no

such exists Furthermore iff 0 1 and 0 2 then 1 2 can be deduced From 1 2 anything can be deduced thus showing the danger of an inconsistent specification Note that all examples and proofs start with the word Example or Proof and end with the symbol $\square$

Logic and Algebra of Specification Friedrich L. Bauer, Wilfried Brauer, Helmut Schwichtenberg, 2012-12-06 For some years specification of software and hardware systems has been influenced not only by algebraic methods but also by new developments in logic These new developments in logic are partly based on the use of algorithmic techniques in deduction and proving methods but are also due to new theoretical advances to a great extent stimulated by computer science which have led to new types of logic and new logical calculi The new techniques methods and tools from logic combined with algebra based ones offer very powerful and useful tools for the computer scientist which may soon become practical for commercial use where in particular more powerful specification tools are needed for concurrent and distributed systems This volume contains papers based on lectures by leading researchers which were originally given at an international summer school held in Marktoberdorf in 1991 The papers aim to give a foundation for combining logic and algebra for the purposes of specification under the aspects of automated deduction proving techniques concurrency and logic abstract data types and operational semantics and constructive methods

Architectures, Languages and Techniques for Concurrent Systems World Occam and Transputer User Group. Technical Meeting, 1999 During the past fifteen years concurrency in programming languages such as Java rose and fell and again became popular At this moment developers advise us to avoid concurrency in programming They are using a host of deprecated methods in the latest releases How are we to understand the love hate relationship with what should be a widely used approach of tackling real world problems The aim of Architectures Languages and Techniques is to encourage the safe efficient and effective use of parallel computing It is generally agreed that concurrency is found in most real applications and that it should be natural to use concurrency in programming However there has grown up a myth that concurrency is hard and only for the hardened expert The papers collected in this book cover the whole spectrum of concurrency from theoretical underpinnings to applications The message passing style of concurrency developed in the Communicating Sequential Processes CSP approach is considered and extensions are proposed CSP's realization in the programming language occam is used directly for applications as diverse as modeling of concurrent systems and the description of concurrent hardware This latter application may be compared to the use of Java for the same purpose

Concurrency and the use of Java is the subject of further papers as is the provision of CSP like facilities in Java and C and techniques to use these languages to construct reliable concurrent systems At a time when concurrency gives headaches this book brings a welcome breath of fresh air Concurrency can really be a positive way forward

Communicating Process Architectures 2000 World Occam and Transputer User Group. Technical Meeting, 2000

Modern computing systems are built in terms of components and those components communicating Communication systems imply concurrency which is a theme of the WoTUG series Traditionally concurrency has been taught considered and experienced as an advanced and difficult topic The thesis underlying this conference is that that idea is wrong The natural world operates through continuous interaction of massive numbers of autonomous agents at all levels sub atomic human astronomic It seems it is time to mature concurrency into a core engineering discipline that can be used on an everyday basis to simplify problem solutions as well as to enable them The goal of Communicating Process Architectures 2000 was to stimulate discussion and ideas as to the role concurrency should play in future generations of scalable computer infrastructure and applications where scaling means the ability to ramp up functionality stay in control as complexity increases as well as physical metrics such as performance

Transputer and Occam Developments World Occam and Transputer User Group. Technical Meeting, 1995 This volume contains papers presented at the 18th meeting of the World Occam and Transputer User Group Wotug The papers cover a wide range of transputer and OCCAM related topics such as the the porting and development of the OCCAM language highlighting the need for cross platform implementations of OCCAM compilers design approaches and applications
