Post Treatments of Anaerobically Treated Effluents Vinay Kumar Tyagi,Abid Ali Khan,Ng Wun Jern,Anwar Khursheed,A. A. Kazmi,2019-06-15 The anaerobic process is considered to be a sustainable technology for organic waste treatment mainly due to its lower energy consumption and production of residual solids coupled with the prospect of energy recovery from the biogas generated However the anaerobic process cannot be seen as providing the complete solution as its treated effluents would typically not meet the desired discharge limits in terms of residual carbon nutrients and pathogens This has given impetus to subsequent post treatment in order to meet the environmental legislations and protect the receiving water bodies and environment This book discusses anaerobic treatment from the perspective of organic wastes and wastewaters municipal and industrial followed by various post treatment options for anaerobic effluent polishing and resource recovery Coverage will also be from the perspective of future trends and thoughts on anaerobic technologies being able to support meeting the increasingly stringent disposal standards The resource recovery angle is particularly interesting as this can arguably help achieve the circular economy It is intended the information can be used to identify appropriate

solutions for anaerobic effluent treatment and possible alternative approaches to the commonly applied post treatment techniques The succeeding discussion is intended to lead on to identification of opportunities for further research and development This book can be used as a standard reference book and textbook in universities for Master and Doctoral students The academic community relevant to the subject namely faculty researchers scientists and practicing engineers will find the book both informative and as a useful source of successful case studies

Activated Sludge: Developments And Sustainable Solutions Nicholas F Gray, 2023-02-27

Activated sludge is the most widely used biological wastewater treatment process globally to date although its high energy demand makes it a major contributor of greenhouse gas emissions Over recent decades it has been constantly modified and retrofitted to treat ever higher loads or improve effluent standards which have often resulted in even greater carbon emissions

Conventional activated sludge treatment is at a crossroads where new sustainable solutions are required if we are to protect the quality of our rivers and meet net zero carbon targets

The book details current operation and design with special emphasis on the biological aspects of the process From the microbial kinetics to the fascinating process of floc formation and development the book explores the development of our understanding of the process looking at new sustainable designs including biological nutrient removal and new aeration systems

Sludge separation problems and control options are explained with a trouble shooting guide to non bulking problems

Environmental issues including noise odor aerosols micro plastics and nanoparticles are all reviewed as is pathogen removal and the problem of antibiotic resistant genes and bacteria

The development of membrane bioreactors has increased process reliability and effluent quality while integrated fixed film activated sludge processes are more efficient and compact

The book concludes by exploring how activated sludge can become more sustainable for example by carbon harvesting and byproduct recovery

This interdisciplinary book is essential reading for both engineers and scientists whether training at university or practitioners and consultants in the wastewater industry
