Identification of Practices, Design, Construction, and Repair Using Trenchless Technology , 2010 Trenchless technologies are methods used for the construction and rehabilitation of underground utility pipes These methods are growing increasingly popular due to their versatility and their potential to lower project costs However the use of trenchless technologies in Iowa and their effects on surrounding soil and nearby structures has not been adequately documented

Surveys of and interviews with professionals working in trenchless related industries in Iowa were conducted and the results were analyzed and compared to survey results from the United States as a whole The surveys focused on method familiarity pavement distress observed reliability of trenchless methods and future improvements Results indicate that the frequency of pavement distress or other trenchless related issues are an ongoing problem in the industry Inadequate soil information and quality control quality assurance QC QA are partially to blame

NASTT's Pipe Ramming Good Practices Guidelines North American Society for Trenchless Technology (NASTT), 2020-03-15 This Pipe Ramming publication is presented by the North American Society for Trenchless Technology NASTT a non profit educational organization The published work serves as a companion document to a portion of NASTT's

New Installations Good Practices Training Course and is intended to provide contractors engineers and utility owners with an overview of the many benefits of this widely practiced trenchless method Pipe ramming is defined as a trenchless technique used to install open ended steel casings by the hammering action of a percussion hammer It is an extension of older techniques that use displacement tools to install small diameter pipes and the application is similar to vertical pile driving The pipe ramming method provides continuous support of the overburden soil with a steel casing as well as support at the excavation face from the soil that is typically left within the pipe during the ramming process The method has seen extensive use to install casings for culverts and utilities beneath raised features such as railroad track and roadway embankments This non steerable trenchless technology is generally considered to have a low risk of over excavation related settlement in most ground conditions All NASTT publications are peer reviewed by volunteer industry professionals to ensure that they offer generic and non commercial information This publication was funded solely by NASTT as part of our educational outreach programing Since 1990 the all volunteer members of NASTT have presented non commercial information about green alternative engineering methods to North American communities and beyond NASTT offers multiple high quality trenchless courses each year throughout North America and at our annual NASTT No Dig Show Conference and Exhibition For more information on our many educational and networking opportunities please visit nastt.org and nodigshow.com
