BACKGROUND AND DEFINITIONS

TRIGONOMETRY DEFINED

Trigonometry is the study of relationships between angles and lengths, especially in triangles.

THE COORDINATE PLANE

The Cartesian (or rectangular) plane is an infinite plane with two special perpendicular lines called axes. A point in the plane is described by an ordered pair of coordinates—the distances from the two axes.

- x-axis:** Usually, the horizontal axis of the coordinate plane.
- y-axis:** Usually, the vertical axis of the coordinate plane.
- Origin (0,0):** The point of intersection of the x-axis and the y-axis.
- Quadrants:** The four regions of the coordinate plane created by the intersection of the two axes. By convention, they are numbered I, II, III, and IV counter-clockwise, starting with the upper-right quadrant.

FUNCTIONS

For more about functions, see the SparkCharts on Functions.

- Function:** A rule for generating values. For every value you plug into the function, there's a unique value that comes out. Often denoted as $f(x)$. For every value $x = a$ that you plug in, $f(a)$ is the result.
- Domain:** The set of possible incoming values, x , for a function $f(x)$.
- Range:** The set of possible outcomes of $f(x)$.
- Graphing a function:** The process of plotting all the points $(x, f(x))$ in the coordinate plane.
- Vertical line test:** Checks if something is a function by looking at its graph; any vertical line in the coordinate plane must intersect the graph no more than once. The study of rates, then, is at least one graph.

ANGLES

- Ray:** Part of a line with one fixed endpoint extending infinitely in one direction.
- Two rays that share a common endpoint create an angle.** The common endpoint is called the **vertex** of the angle.
- Often we think of an angle as being formed by rotating a ray clockwise or counterclockwise.** We start clockwise between the **initial side** (starting position of the ray) and the **terminal side** (end position of the ray) of the angle.

MEASURING ANGLES

Two rays that originate from the same vertex or intersect their rays. There are two accepted units for measuring angles.

- Degree (°):** A unit of angular measure in which a complete revolution is 360°. Each degree is subdivided into 60 minutes, and each minute is subdivided into 60 seconds.
- Radian (rad):** A unit of angular measure in which a complete revolution measures 2π radians. The radius length of an angle is the length of an arc of the unit circle cut off by that angle.
- Converting between degrees and radians:**
 - 1 revolution = 360° = 2π rad
 - 1 rad = 360° / 2π revolutions
 - 1° = 2π / 360 rad = π / 180 radians
- Adding angles:** When viewed as geometric objects, angles are usually added with equal letters—often when the vertex (0,0) and initial sides are shared in diagrams. When viewed as rotations, angle measures are often given in degrees (30°, 45°, 60°) and are usually specified in radians. In trigonometry—either in geometry—the distinction between angles and their measures is often not made (30° = π/6).

ANGLES IN THE COORDINATE PLANE

- Standard position:** An angle is in standard position when its vertex lies at the origin and its initial side lies along the positive x-axis.
- Unit circle:** The circle of radius 1 centered at the origin. Any angle gives a point on the unit circle.
- Negative and positive angles:** By convention, positive angles are measured counterclockwise, negative angles are measured clockwise.
- Multiple rotations:** The angles 30°, 390° = 360° + 30°, 750° = 2(360°) + 30°, all define the same point on the unit circle.
- Reference angles:** Any angle in standard position, the reference angle is the positive acute angle formed by its terminal side and the x-axis.

TYPES OF ANGLES

- Zero angle:** 0° = 0 rad. The initial side and the terminal side coincide. In standard position, the terminal side is on the positive x-axis.
- Acute angle:** less than 90° = π/2 rad. There are a zero angle and a right angle. In standard position, the terminal side is in Quadrant I.
- Right angle:** 90° = π/2 rad. The initial side is perpendicular to the terminal side. In standard position, the terminal side is on the positive y-axis.
- Obtuse angle:** either greater than 90° = π/2 rad and less than 180° = π rad. Between a right angle and a straight angle. In standard position, the terminal side is in Quadrant II.
- Straight angle:** 180° = π rad. The initial side and the terminal side form the same line. In standard position, the terminal side is on the negative x-axis.
- Oblique angle:** either acute or obtuse (not zero, right, or straight).
- Complementary angles:** Two angles that sum to a right angle.
- Supplementary angles:** Two angles that sum to a straight angle.
- Concurrent angles:** Two angles in standard position whose terminal sides coincide. Angles θ and φ are concurrent if θ = φ + 2kπ for some integer k (positive or negative).

TRIGONOMETRIC FUNCTIONS

The two ways of thinking about angles—as rotations from the standard position, or as acute angles in a geometric figure—give two ways of thinking about trigonometric functions.

...BASED ON THE UNIT CIRCLE

Any angle θ defines a point

$P = (x, y)$ on the unit circle.

Considering the coordinates of this point give the trigonometric functions of θ.

- Sine:** $\sin \theta = y$, the y-coordinate of P. For all θ, $-1 \leq \sin \theta \leq 1$.
- Cosine:** $\cos \theta = x$, the x-coordinate of P. For all θ, $-1 \leq \cos \theta \leq 1$.
- Tangent:** $\tan \theta = \frac{y}{x}$, the slope of the line OP.
- Secant:** $\sec \theta = \frac{1}{x} = \frac{1}{\cos \theta}$

- Cosecant:** $\csc \theta = \frac{1}{y} = \frac{1}{\sin \theta}$
- Cotangent:** $\cot \theta = \frac{x}{y} = \frac{1}{\tan \theta} = \frac{\cos \theta}{\sin \theta}$

Because θ and θ + 2πi define the same point on the unit circle, all trigonometric functions are periodic with a period of 2π (360°), or π (180°) for tan and cot.

...BASED ON A RIGHT TRIANGLE

For any acute angle θ, we can define the trigonometric functions by looking at the ratios of the side lengths of a right triangle. A 90° right triangle with θ has side lengths a, b, and c to the point A, the angle C is 90°, and the measure of angle A is θ.

- Sine:** $\sin \theta = \frac{a}{c} = \frac{\text{opposite side}}{\text{hypotenuse}}$
- Cosine:** $\cos \theta = \frac{b}{c}$ for all acute angles θ.
- Cotangent:** $\cot \theta = \frac{b}{a} = \frac{\text{adjacent side}}{\text{opposite side}}$
- Secant:** $\sec \theta = \frac{c}{b}$ for all acute angles θ.
- Tangent:** $\tan \theta = \frac{a}{b} = \frac{\text{opposite side}}{\text{adjacent side}}$

TRIGONOMETRIC SPIDERSHOTS: Sine is Opposite over Hypotenuse, Cosine is Adjacent over Hypotenuse, Tangent is Opposite over Adjacent.

- Cosecant:** $\csc \theta = \frac{c}{a} = \frac{\text{hypotenuse}}{\text{opposite side}} = \frac{1}{\sin \theta}$
- Secant:** $\sec \theta = \frac{c}{b} = \frac{\text{hypotenuse}}{\text{adjacent side}} = \frac{1}{\cos \theta}$
- Cotangent:** $\cot \theta = \frac{b}{a} = \frac{\text{adjacent side}}{\text{opposite side}} = \frac{1}{\tan \theta}$
