

H2 PART C. IGNITION COILS

The ignition coils consist of primary and secondary windings wound concentrically about a laminated soft iron core, the secondary winding being next to the core. The primary winding usually consists of some 300 turns of enamel covered wire and the secondary some 17,000–26,000 turns of much finer wire—also enamel covered. Each layer is paper insulated from the next in both primary and secondary windings.

To test the ignition coil on the machine, first ensure that the low tension circuit is in order as described in H2 Part A above then disconnect the high tension leads from the left and right sparking plugs. Turn the ignition switch to the "IGN" position and crank the engine until the contacts (those with the black/yellow lead from the ignition coil) for the right cylinder are closed. Flick the contact breaker lever open a number of times whilst the high tension lead from the right ignition coil is held about $\frac{1}{4}$ in. away from the cylinder head. If the ignition coil is in good condition a strong spark should be obtained. If no spark occurs this indicates the ignition coil to be faulty.

Repeat this test for the left high tension lead and coil by cranking the engine until the contacts with the black/white lead from the left ignition coil are closed.

Fig. H2. Ignition coils in position on machine

Before a fault can be attributed to an ignition coil it must be ascertained that the high tension cables are not cracked or showing signs of deterioration, as this may often be the cause of mis-firing, etc. It should also be checked that the ignition points are actually making good electrical contact when closed

and that the moving contact is insulated from earth (ground) when open. It is advisable to remove the ignition coils and test them by the method described below.

BENCH TESTING AN IGNITION COIL

Connect the ignition coil into the circuit shown in Fig. H3 and set the adjustable gap to 8 mm. for MA6 coils and 9 mm. for MA12 types. With the contact breaker running at 100 r.p.m. and the coil in good condition, not more than 5% missing should occur at the spark gap over a period of 15 seconds. The primary winding can be checked for short-circuit coils by connecting an ohmmeter across the low-tension terminals. The reading obtained should be within the figures quoted below (at 20°C).

Coil	Primary Resistance	
	Min.	Max.
MA6	1.8 ohms.	2.4 ohms.
MA12	3.0 ohms.	3.4 ohms.

Fig. H3. Ignition coil test rig

H2 PART D. CONTACT BREAKER

Faults occurring at the contact breaker are in the main due to incorrect adjustments of the contacts or the efficiency being impaired by piling, pitting or oxidation of the contacts due to oil etc. Therefore, always ensure that the points are clean and that the gap is adjusted to the correct working clearance as described in Section B31.
