Homological Theory of Representations Henning Krause, 2021-11-18 Modern developments in representation theory rely heavily on homological methods This book for advanced graduate students and researchers introduces these methods from their foundations up and discusses several landmark results that illustrate their power and beauty Categorical foundations include abelian and derived categories with an emphasis on localisation spectra and purity The representation theoretic focus is on module categories of Artin algebras with discussions of the representation theory of finite groups and finite quivers Also covered are Gorenstein and quasi hereditary algebras including Schur algebras which model polynomial representations of general linear groups and the Morita theory of derived categories via tilting objects The final part is devoted to a systematic introduction to the theory of purity for locally finitely presented categories covering pure injectives definable subcategories and Ziegler spectra With its clear detailed exposition of important topics in modern representation theory many of which were unavailable in one volume until now it deserves a place in every representation theorist's library

Bousfield Classes and Ohkawa's Theorem Takeo Ohsawa, Norihiko Minami, 2020-03-18 This volume originated in the workshop held at Nagoya University August 28-30 2015 focusing on the surprising and mysterious Ohkawa's theorem the Bousfield classes in the stable homotopy category SH form a set An inspiring extensive mathematical story can be narrated starting with Ohkawa's theorem evolving naturally with a chain of motivational questions Ohkawa's theorem states that the Bousfield classes of the stable homotopy category SH surprisingly forms a set which is still very mysterious Are there any toy models where analogous Bousfield classes form a set with a clear meaning The fundamental theorem of Hopkins Neeman Thomason and others states that the analogue of the Bousfield classes in the derived category of quasi coherent sheaves $D_{qc}(X)$ form a set with a clear algebro geometric description However Hopkins was actually motivated not by Ohkawa's theorem but by his own theorem with Smith in the triangulated subcategory SH_c consisting of compact objects in SH Now the following questions naturally occur 1 Having theorems of Ohkawa and Hopkins Smith in SH are there analogues for the Morel Voevodsky A_1 stable homotopy category $SH(k)$ which subsumes SH when k is a subfield of $\mathbb{C}$ 2 Was it not natural for Hopkins to have considered $D_{qc}(X_c)$ instead of $D_{qc}(X)$ However whereas there is a conceptually simple algebro geometrical interpretation $D_{qc}(X_c) \simeq D_{perf}(X)$ it is its close relative $Db_{coh}(X)$ that traditionally ever since Oka and Cartan has been intensively studied because of its rich geometric and physical information This book contains developments for the rest of the story and much more including the chromatics homotopy theory which the Hopkins Smith theorem is based upon and applications of Lurie's higher algebra all by distinguished contributors

Ergodic Theory and Dynamical Systems Idris Assani, 2024-06-04 This book grew out of the 2021 Chapel Hill Ergodic Theory Workshop <https://ergwork.web.unc.edu/schedule-of-talks-201/> during which young and senior researchers presented recent advances in ergodic theory and dynamical systems Included are original research and survey articles devoted to various topics in Ergodic Theory and Dynamical

Systems Some are from presenters at this workshop This book attracts young and senior researchers alike **Leavitt Path Algebras and Classical K-Theory** A. A. Ambily, Roozbeh Hazrat, B. Sury, 2020-01-17 The book offers a comprehensive introduction to Leavitt path algebras LPAs and graph C algebras Highlighting their significant connection with classical K theory which plays an important role in mathematics and its related emerging fields this book allows readers from diverse mathematical backgrounds to understand and appreciate these structures The articles on LPAs are mostly of an expository nature and the ones dealing with K theory provide new proofs and are accessible to interested students and beginners of the field It is a useful resource for graduate students and researchers working in this field and related areas such as C algebras and symbolic dynamics **An Invitation To Noncommutative Geometry** Matilde Marcolli, Masoud Khalkhali, 2008-02-11 This is the first existing volume that collects lectures on this important and fast developing subject in mathematics The lectures are given by leading experts in the field and the range of topics is kept as broad as possible by including both the algebraic and the differential aspects of noncommutative geometry as well as recent applications to theoretical physics and number theory **Topics in Algebraic and Topological K-Theory** Paul Frank Baum, Guillermo Cortiñas, Ralf Meyer, Rubén Sánchez-García, Marco Schlichting, Bertrand Toën, 2010-10-28 This volume is an introductory textbook to K theory both algebraic and topological and to various current research topics within the field including Kasparov's bivariant K theory the Baum Connes conjecture the comparison between algebraic and topological K theory of topological algebras the K theory of schemes and the theory of dg categories *A First Course in Category Theory* Ana Agore, 2023-12-12 This textbook provides a first introduction to category theory a powerful framework and tool for understanding mathematical structures Designed for students with no previous knowledge of the subject this book offers a gentle approach to mastering its fundamental principles Unlike traditional category theory books which can often be overwhelming for beginners this book has been carefully crafted to offer a clear and concise introduction to the subject It covers all the essential topics including categories functors natural transformations duality equivalence co limits and adjunctions Abundant fully worked examples guide readers in understanding the core concepts while complete proofs and instructive exercises reinforce comprehension and promote self study The author also provides background material and references making the book suitable for those with a basic understanding of groups rings modules topological spaces and set theory Based on the author's course at the Vrije Universiteit Brussel the book is perfectly suited for classroom use in a first introductory course in category theory Its clear and concise style coupled with its detailed coverage of key concepts makes it equally suited for self study *Noncommutative Motives* Gonçalo Tabuada, 2015-09-21 The theory of motives began in the early 1960s when Grothendieck envisioned the existence of a universal cohomology theory of algebraic varieties The theory of noncommutative motives is more recent It began in the 1980s when the Moscow school Beilinson Bondal Kapranov Manin and others began the study of algebraic varieties via their derived categories of coherent sheaves and continued in the 2000s when Kontsevich

conjectured the existence of a universal invariant of noncommutative algebraic varieties This book prefaced by Yuri I Manin gives a rigorous overview of some of the main advances in the theory of noncommutative motives It is divided into three main parts The first part which is of independent interest is devoted to the study of DG categories from a homotopical viewpoint The second part written with an emphasis on examples and applications covers the theory of noncommutative pure motives noncommutative standard conjectures noncommutative motivic Galois groups and also the relations between these notions and their commutative counterparts The last part is devoted to the theory of noncommutative mixed motives The rigorous formalization of this latter theory requires the language of Grothendieck derivators which for the reader's convenience is revised in a brief appendix

Stable Homotopy Around the Arf-Kervaire Invariant Victor P. Snaith, 2009-03-28 Were I to take an iron gun And re it o towards the sun I grant twould reach its mark at last But not till many years had passed But should that bullet change its force And to the planets take its course Twould never reach the nearest star Because it is so very far from FACTS by Lewis Carroll 55 Let me begin by describing the two purposes which prompted me to write this monograph This is a book about algebraic topology and more especially about homotopy theory Since the inception of algebraic topology 217 the study of homotopy classes of continuous maps between spheres has enjoyed a very exc n n tional central role As is well known for homotopy classes of maps $f: S^n \rightarrow S^n$ with $n \geq 1$ the sole homotopy invariant is the degree which characterises the homotopy class completely The search for a continuous map between spheres of different dimensions and not homotopic to the constant map had to wait for its resolution until the remarkable paper of Heinz Hopf 111 In retrospect nding 3 an example was rather easy because there is a canonical quotient map from S^3 to S^1 2 the orbit space of the free circle action $S^1 \times CP^1 \rightarrow CP^1$

Motivic Integration Antoine Chambert-Loir, Johannes Nicaise, Julien Sebag, 2018-09-15 This monograph focuses on the geometric theory of motivic integration which takes its values in the Grothendieck ring of varieties This theory is rooted in a groundbreaking idea of Kontsevich and was further developed by Denef Loeser and Sebag It is presented in the context of formal schemes over a discrete valuation ring without any restriction on the residue characteristic The text first discusses the main features of the Grothendieck ring of varieties arc schemes and Greenberg schemes It then moves on to motivic integration and its applications to birational geometry and non Archimedean geometry Also included in the work is a prologue on p -adic analytic manifolds which served as a model for motivic integration With its extensive discussion of preliminaries and applications this book is an ideal resource for graduate students of algebraic geometry and researchers of motivic integration It will also serve as a motivation for more recent and sophisticated theories that have been developed since

Applications of Categories in Computer Science M. P. Fourman, P. T. Johnstone, A. M. Pitts, 1992-06-26 Category theory and related topics of mathematics have been increasingly applied to computer science in recent years This book contains selected papers from the London Mathematical Society Symposium on the subject which was held at the University of Durham Participants at the conference were leading computer scientists and mathematicians

working in the area and this volume reflects the excitement and importance of the meeting All the papers have been refereed and represent some of the most important and current ideas Hence this book will be essential to mathematicians and computer scientists working in the applications of category theory

Arithmetic and Geometry of K3 Surfaces and Calabi-Yau Threefolds Radu Laza, Matthias Schütt, Noriko Yui, 2013-06-12 In recent years research in K3 surfaces and Calabi Yau varieties has seen spectacular progress from both arithmetic and geometric points of view which in turn continues to have a huge influence and impact in theoretical physics in particular in string theory The workshop on Arithmetic and Geometry of K3 surfaces and Calabi Yau threefolds held at the Fields Institute August 16 25 2011 aimed to give a state of the art survey of these new developments This proceedings volume includes a representative sampling of the broad range of topics covered by the workshop While the subjects range from arithmetic geometry through algebraic geometry and differential geometry to mathematical physics the papers are naturally related by the common theme of Calabi Yau varieties With the big variety of branches of mathematics and mathematical physics touched upon this area reveals many deep connections between subjects previously considered unrelated Unlike most other conferences the 2011 Calabi Yau workshop started with 3 days of introductory lectures A selection of 4 of these lectures is included in this volume These lectures can be used as a starting point for the graduate students and other junior researchers or as a guide to the subject

Perverse Sheaves and Applications to Representation Theory Pramod N. Achar, 2021-09-27 Since its inception around 1980 the theory of perverse sheaves has been a vital tool of fundamental importance in geometric representation theory This book which aims to make this theory accessible to students and researchers is divided into two parts The first six chapters give a comprehensive account of constructible and perverse sheaves on complex algebraic varieties including such topics as Artin's vanishing theorem smooth descent and the nearby cycles functor This part of the book also has a chapter on the equivariant derived category and brief surveys of side topics including tale and adic sheaves D modules and algebraic stacks The last four chapters of the book show how to put this machinery to work in the context of selected topics in geometric representation theory Kazhdan Lusztig theory Springer theory the geometric Satake equivalence and canonical bases for quantum groups Recent developments such as the p canonical basis are also discussed The book has more than 250 exercises many of which focus on explicit calculations with concrete examples It also features a 4 page Quick Reference that summarizes the most commonly used facts for computations similar to a table of integrals in a calculus textbook

A Handbook of Model Categories Scott Balchin, 2021-10-29 This book outlines a vast array of techniques and methods regarding model categories without focussing on the intricacies of the proofs Quillen model categories are a fundamental tool for the understanding of homotopy theory While many introductions to model categories fall back on the same handful of canonical examples the present book highlights a large self contained collection of other examples which appear throughout the literature In particular it collects a highly scattered literature into a single volume The book is aimed at anyone who uses

or is interested in using model categories to study homotopy theory It is written in such a way that it can be used as a reference guide for those who are already experts in the field However it can also be used as an introduction to the theory for novices

Discrete Groups and Geometry William J. Harvey, C. Maclachlan, 1992-07-30 This book constitutes the proceedings of a conference held at the University of Birmingham to mark the retirement of Professor A M Macbeath The papers represent up to date work on a broad spectrum of topics in the theory of discrete group actions ranging from presentations of finite groups through the detailed study of Fuchsian and crystallographic groups to applications of group actions in low dimensional topology complex analysis algebraic geometry and number theory For those wishing to pursue research in these areas this volume offers a valuable summary of contemporary thought and a source of fresh geometric insights

Complex Projective Geometry G. Ellingsrud, 1992-07-30 A volume of papers describing new methods in algebraic geometry

Minimal Free Resolutions over Complete Intersections David Eisenbud, Irena Peeva, 2016-03-08 This book introduces a theory of higher matrix factorizations for regular sequences and uses it to describe the minimal free resolutions of high syzygy modules over complete intersections Such resolutions have attracted attention ever since the elegant construction of the minimal free resolution of the residue field by Tate in 1957 The theory extends the theory of matrix factorizations of a non zero divisor initiated by Eisenbud in 1980 which yields a description of the eventual structure of minimal free resolutions over a hypersurface ring Matrix factorizations have had many other uses in a wide range of mathematical fields from singularity theory to mathematical physics

Manifolds with Singularities and the Adams-Novikov Spectral Sequence Boris I. Botvinnik, 1992-07-23 Many interesting results not widely known outside the USSR are brought together in this analysis of the Adams Novikov spectral sequence a tool that has enabled the computation of generators and relations to describe homotopy groups

Boolean Function Complexity Michael S. Paterson, 1992-11-05 By considering the size of the logical network needed to perform a given computational task the intrinsic difficulty of that task can be examined Boolean function complexity the combinatorial study of such networks is a subject that started back in the 1950s and has today become one of the most challenging and vigorous areas of theoretical computer science The papers in this book stem from the London Mathematical Society Symposium on Boolean Function Complexity held at Durham University in July 1990 The range of topics covered will be of interest to the newcomer to the field as well as the expert and overall the papers are representative of the research presented at the Symposium Anyone with an interest in Boolean Function complexity will find that this book is a necessary purchase
