

E.2 Critical Parameters for Well Performance Analysis

For a well performance analysis, it is important to identify those items that are critical for the study.

The critical step is to obtain the best match between the simulated production data from the reservoir/flow model output and the current well performance. A good match clearly indicates that the well data and the reservoir parameters used are as close as possible to their true values.

When a match is obtained, the engineer can discuss the possible ways to improve the performance of the candidate well.

The model will also be used to predict the well production after the appropriate treatment and, thus, the proper data for the economic analysis will be generated.

The critical reservoir parameters needed for the well performance analysis include (Figure 3-1)

- Group 1
 - average porosity
 - net pay height
 - reservoir fluid saturations
- Group 2
 - reservoir fluid characteristics
 - initial reservoir pressure
 - reservoir drainage radius
- Group 3
 - average reservoir pressure
 - average net pay permeability
 - existence of fissures or fractures and their characteristics
 - skin factor.
