A **Model** is an element that contains information for a software model.

A **View** is a visual expression of the information contained in a model, and

A **Diagram** is a collection of view elements that represent the user's specific design thoughts.

UML is a language used for visualizing, specifying, constructing and documenting the artifacts of a software intensive system.

A Modeling Language:

UML provides the vocabulary and the rules for communication and focus on conceptual and physical representations of the system. So it is a modeling language.

UML Visualizes:

UML includes both graphical and textual representation and makes easy to visualize the system and for better understanding.

UML specifies:

UML addresses the specification of all the important analysis, design implementation decisions, developing and deploying a software intensive system.

UML Constructs:

UML models can be directly connected to a variety of programming languages. And it is sufficiently expressive and free from any ambiguity to permit the direct execution of models, simulation of systems, and the instrumentation of running systems.

UML Documents:

UML produces variety of documents, in addition to raw executable code, the artifacts include requirements, Architecture, Design, Source code, Project Plans, Test, Prototypes, Releases.
