Natural Computing for Simulation and Knowledge Discovery Nunes de Castro, Leandro, 2013-07-31 Nature has long provided the inspiration for a variety of scientific discoveries in engineering, biomedicine, and computing, though only recently have these elements of nature been used directly in computational systems. *Natural Computing for Simulation and Knowledge Discovery* investigates the latest developments in nature-influenced technologies. Within its pages, readers will find an in-depth analysis of such advances as cryptographic solutions based on cell division, the creation and manipulation of biological computers, and particle swarm optimization techniques. Scientists, practitioners, and students in fields such as computing, mathematics, and molecular science will make use of this essential reference to explore current trends in natural computation and advance nature-inspired technologies to the next generation.

Approaching human intelligence through chemical systems: Development of unconventional chemical artificial intelligence Pier Luigi Gentili, Konrad Szaciłowski, Andrew Adamatzky, 2023-11-27 Although human intelligence is deeply investigated by neuroscientists, psychologists, philosophers, and AI researchers, we still lack a widely accepted definition of what it is. If we exploit the emergence theory from Complexity Science to give a definition, we might state that human intelligence is the emergent property of the human nervous system. Such a fascinating emergent property allows us to handle both accurate and vague information by computing with numbers and words. Moreover, it allows us to reason, speak, and take rational decisions in an environment of uncertainty, partiality, and relativity of truth when the Incompatibility Principle holds. As the complexity of a system increases, accuracy and significance become almost mutually exclusive characteristics of our statements. Finally, our intelligence allows us to recognize quite easily variable patterns. Therefore, it is worthwhile investigating human intelligence and trying to mimic it by developing Artificial Intelligence. Nowadays, Artificial Intelligence is in vogue; it is applied in both basic and applied science. Traditionally, there are two strategies to develop Artificial Intelligence. A strategy consists in writing human-like intelligent software running on von Neumann computers or special-purpose hardware. The other strategy consists in neuromorphic engineering. Neuromorphic engineering implements surrogates of neurons through non-biological systems, either for neuroprosthesis or to design brain-like computing machines. A third strategy is now blooming, and it consists in using molecular/supramolecular materials and systems chemistry to mimic some basic functions of human intelligence, such as Boolean multi-valued logic gates and Fuzzy logic. This third strategy is originating Chemical Artificial Intelligence (CAI). A relevant purpose of CAI is to design modules for Chemical Robots. A Chemical Robot is thought of as a molecular assembly that reacts autonomously to its environment by probing it with molecular sensors, making decisions by its intrinsic Artificial Neural Networks or logic gates, and performing actions upon its environment through molecular effectors. The intelligent activities of any Chemical Robot should be sustained energetically by a metabolic unit. Chemical Robots should be easily miniaturized and implanted in living beings to interplay with cells or organelles for biomedical applications. They should become auxiliary elements of the natural immune
