Mind John H. Flavell, 2003 *The Emergence of a Temporally Extended Self and Factors that Contribute to Its Development*

Mary Lazaridis, 2013 The main aims of the current research were to determine when children develop a temporally extended self TES and what factors contribute to its development However in order to address these aims it was important to first assess whether the test of Delayed Self Recognition DSR is a valid measure for the development of the TES and second to propose and evaluate a theoretical model that describes what factors influence the development of the TES The validity of the DSR test was verified by comparing the performance of 57 children on the DSR test to their performance on a meta representational task modified false belief task and to a task that was essentially the same as the DSR test but was specifically designed to rely on the capacity to entertain secondary representations i e surprise body task Longitudinal testing of the children showed that at the mental age MA of 2 5 years they failed the DSR test despite training them to understand the intended functions of the medium used in the DSR test whereas with training children at the MA of 3 0 and 3

5 years exhibited DSR Children at the MA of 4 years exhibited DSR without any training Finally results suggest that children's meta representational ability was the only factor that contributed to the prediction of successful performance on the DSR test and thus to the emergence of the TES That is children of low elaborative caregivers required significantly more training to pass the DSR test than children of high elaborative caregivers indicating that children who received more elaborative conversational input from their caregivers had a more advanced understanding of the TES

Autism and Cognitive Architecture Miklós Győri, 2006 The present volume attempts to integrate two streams of cognitive research which often run parallel largely conceptual investigations on the overall framework of human cognition and the much more empirical study of neurocognitive developmental disorders in this case autism The book is partly a conceptual analysis exploring the issue of domain specificity and its place in cognitive theory but it also offers a detailed summary of the phenomena of autism a critical evaluation of its cognitive psychological models and presents new empirical findings on the complexity of beyond childhood development of theory of mind ability in autism Besides the integration and an overview of these three major themes the novelty of the presented theses lies primarily in the comprehensiveness of the offered conceptual framework for domain specificity and in the empirical findings which strongly suggest that functioning theory of mind ability and non theory of mind compensatory strategies co exist
