methods Ensure that the model runs efficiently on modern high speed computers Use high quality input data both meteorological data and emission inventories in the runs Verify the model results by comparing them with reliable measurements taken in different parts of the spatial domain of the model Carry out long series of sensitivity experiments to check the response of the model to changes of different key parameters Visualize and animate the output results in order to make them easily understandable even to non specialists This monograph thoroughly describes mathematical methods useful for various situations in environmental modeling including finite difference methods splitting methods parallel computation etc and provides a framework for resolving problems posed in relation to the points listed above Chapters are written by well known specialists making this book a handy reference for researchers university teachers and students working and studying in the areas of air pollution meteorology applied mathematics and computer science **Satellite Orbits** Oliver

Montenbruck,Eberhard Gill,2012-12-06 Satellite Orbits Models Methods and Applications has been written as a comprehensive textbook that guides the reader through the theory and practice of satellite orbit prediction and determination Starting from the basic principles of orbital mechanics it covers elaborate force models as well as precise methods of satellite tracking and their mathematical treatment A multitude of numerical algorithms used in present day satellite trajectory computation is described in detail with proper focus on numerical integration and parameter estimation The wide range of levels provided renders the book suitable for an advanced undergraduate or graduate course on spaceflight mechanics up to a professional reference in navigation geodesy and space science Furthermore we hope that it is considered useful by the increasing number of satellite engineers and operators trying to obtain a deeper understanding of flight dynamics The idea for this book emerged when we realized that documentation on the methods models and tools of orbit determination was either spread over numerous technical and scientific publications or hidden in software descriptions that are not in general accessible to a wider community Having worked for many years in the field of spaceflight dynamics and satellite operations we tried to keep in close touch with questions and problems that arise during daily work and to stress the practical aspects of orbit determination Nevertheless our interest in the underlying physics motivated us to present topics from first principles and make the book much more than just a cookbook on spacecraft trajectory computation
