

ROLLING ELEMENT BEARING FAILURE MODES

Rolling element bearings are subject to a wide range of failure modes. The most common failure mode is fatigue, which is caused by the repeated loading and unloading of the bearing surfaces. Other failure modes include corrosion, misalignment, and lubrication failure.

Rolling element bearings can be classified into two main types: deep groove ball bearings and tapered roller bearings. Each type has its own set of failure modes and symptoms.

Rolling element bearings can be inspected visually for signs of failure. Common signs include discoloration, pitting, and scoring. More advanced inspection techniques, such as vibration analysis, can also be used to detect bearing failure.

Rolling element bearings should be replaced when they show signs of failure. It is important to replace the bearing as soon as possible to avoid further damage to the machine.

Rolling element bearings should be lubricated regularly to prevent failure. The correct lubricant and lubrication schedule should be followed for each bearing.

Rolling element bearings should be inspected regularly to detect any signs of failure. A regular inspection schedule should be established for each bearing.
