

Figure: Trifiller suspension

Theory: the disc is now turned through a small angle its vertical axis, the cords become inclined. On being released the disc will perform oscillations about the vertical axis. At any instant

Let: θ = angular displacement of the disc

F = tension in each cord $= w/3$

Inertia torque $= I \times \alpha$

Restoring torque $= 3 \times \text{horizontal component forces of each string} \times r$

Inertia torque = restoring torque

Description: a uniform circular disc is suspended from the pendulum support frame by three parallel cords. Top ends of the cords pass through the three small chucks fitted at the top. Other ends are secured in the trifilar disc. It is possible to adjust the length of the chord by loosening the chucks.

Utilities required:

Floor area required: $.5 \text{ m} \times .5 \text{ m}$

1. Allow the disc to oscillate about the vertical axis passing through centre
2. Measure the oscillation with time.
3. Repeat the experiment for different lengths & different radius.
