

THERMAL ENERGY READINGS & QUESTIONS

Types of Heat Transfer

Temperature differences are not as we realize for the air conditions, convection, and radiation.

Convection is heat transfer by the movement of fluids.

As air is heated, it expands and becomes less dense. This is because the air molecules are moving faster and the air becomes less dense. This makes the air rise and the air cools as it rises and the air becomes more dense. This makes the air sink and the air is heated again. Convection is found in the atmosphere, in the ocean, and in the Earth's interior. Cooler water sinks and warmer water rises.

Radiation is heat transfer by electromagnetic waves.

Radiation is the transfer of energy by electromagnetic waves. It does not require a medium and can travel through a vacuum. Examples of radiation include the heat from the sun, the heat from a fire, and the heat from a microwave oven.

Particle Arrangement

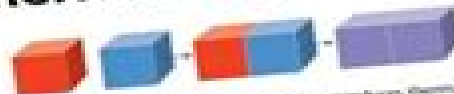

To understand the particle arrangement of a substance, you need to know its state of matter.

On Earth, all matter is in one of three states: solid, liquid, or gas.

Figure 1.1: Solid

Thermal Equilibrium

Particles are always vibrating and this vibrating motion produces thermal energy. All matter is constantly vibrating, so all matter has some amount of thermal energy. Heat transfer is how thermal energy moves from one place to another. Looking for it, it is easy to predict how heat moves. Thermal energy will always travel from warmer objects to cooler objects until the energy is equally distributed. When you have two objects that are at different temperatures, thermal energy moves from the warmer object to the cooler object until they are both at the same temperature. This is referred to as reaching **thermal equilibrium**.
