Designed to complement the course, the manual focuses on understanding and appreciating the impact of pharmaceutical additives and various dosage forms on drug performance. By providing detailed protocols and guidelines for experiments, the manual allows students to explore the complexities of different pharmaceutical forms such as tablets, capsules, eye drops, cold creams, and vanishing creams. It aims to bridge theoretical knowledge with practical skills, ensuring students can effectively apply their understanding of dosage form development and manufacturing techniques. Upon completion, students are expected to achieve several key objectives. They will gain comprehensive knowledge about the various pharmaceutical dosage forms and the specific techniques used to manufacture them. The manual covers considerations essential for developing effective pharmaceutical products, including the selection and use of additives. Students will also learn to formulate various dosage forms and evaluate them for quality and efficacy. By emphasizing both the scientific and practical aspects of pharmaceutical engineering, the manual prepares students to tackle real-world challenges in drug formulation and quality control, fostering a deeper understanding of how dosage forms influence drug performance. Podile, J.W. Kloepper, 2010-01-01. Today many economically important agricultural, horticultural, and ornamental crop plants are attacked by various soil-borne and foliar diseases, resulting in billions of dollars in crop losses. Currently, the most widely used disease management strategy is the use of chemical fungicides. However, the use of these fungicides has encountered problems such as development of resistance by pathogen to fungicides and rapid degradation of the chemicals. Other factors leading to increased interest in alternatives include the increasing cost of soil fumigation, lack of suitable replacements for methyl bromide, and public concerns over exposure to fungicides. Both the agriculture and agri-food sector are now expected to move toward environmentally sustainable development while maintaining productivity. These concerns and expectations have led to renewed interest in the use of biologically based pest management strategies. The green revolution of agriculture brought an enormous increase in food production. It not only made the world self-sufficient in food but also gave the world's scientists and farmers an immense amount of self-respect. Though the green revolution did increase food production, the productivity levels have remained low, and increase was achieved at a cost of intensive use of water, fertilizer, and other inputs, which have
