Biogeography, Time and Place: Distributions, Barriers and Islands Willem Renema, 2007-09-07 Biogeography considers the distribution of biological units over a wide range of scales The units range from genotypes populations and species to families and higher taxa Processes can be local such as the isolation on islands due to sea level fluctuations or large scale tectonic processes that separates continents and creates oceans In all processes time is an important factor and by combining data on recent patterns with paleontological data the understanding of the distribution of extant taxa can be improved This volume focuses on speciation due to isolation in island like settings and the evolution of large scale diversity as the result of origination maintenance and extinction

Indian Insects S Ramani, Prashanth Mohanraj, Yeshwanth HM, 2019-10-16. Insects are the most interesting and diverse group of organisms on earth many of which are useful as pollinators of crops and wild plants while others are useful as natural enemies keeping pestiferous insects in check. It is important to conserve these insects for our survival and for this the diversity of insect species inhabiting the different ecosystems of our country must be known. The cornerstone to studies of any kind of organismal diversity is their taxonomic identity. Even after over two and half centuries of studies so little is known of the insect wealth of our country. It has contributions from taxonomists who have been studying Indian insects for long. This book offers up to date information on many important groups of Indian insects seeking to fill the lacuna of a long felt need for a comprehensive work on the taxonomy of Indian insects. Salient features: Provides an up to date taxonomy of major insect groups of India. Presents identification keys with illustrations of several important groups of Indian insects. Gives a new insight into why insects are so abundant. Addresses fundamental questions in mechanoreception and cross kingdom interactions using insects as model systems. **Indian Insects Diversity and Science** is a festschrift to Professor C A Viraktamath an insect taxonomist par excellence. It has been designed to cater to the needs of academicians, researchers and students who wish to identify insects collected from local environments and will be an invaluable aid for those working in the areas of systematics, ecology, behaviour, diversity and the conservation of insects.

Tropical Stream Ecology David Dudgeon, 2011-05-04. **Tropical Stream Ecology** describes the main features of tropical streams and their ecology. It covers the major physico-chemical features, important processes such as primary production and organic matter transformation as well as the main groups of consumers: invertebrates, fishes and other vertebrates. Information on concepts and paradigms developed in north temperate latitudes and how they do not match the reality of ecosystems further south is expertly addressed. The pressing matter of conservation of tropical streams and their biodiversity is included in almost every chapter with a final chapter providing a synthesis on conservation issues. For the first time **Tropical Stream Ecology** places an important emphasis on viewing research carried out in contributions from international literature. First synthetic account of the ecology of all types of tropical streams. Covers all of the major tropical regions. Detailed consideration of possible fundamental differences between tropical and temperate stream ecosystems. Threats faced by tropical stream ecosystems and possible conservation actions. Descriptions and syntheses of life histories and breeding patterns of major aquatic consumers: fishes, invertebrates.

Introduction to Insects, **Insect Metamorphosis** Xavier Belles, 2020-03-17. **Insect Metamorphosis** From Natural History to Regulation of

Development and Evolution explores the origin of metamorphosis how it evolved and how it is it regulated The book discusses insect metamorphosis as a key innovation in insect evolution With most of the present biodiversity on Earth composed of metamorphosing insects approximately 1 million species currently described with another 10 30 million still waiting to be discovered the book delves into misconceptions and past treatments In addition the topic of integrating insect metamorphosis into the theory of evolution by natural selection as noted by Darwin in his On the Origin of Species is also discussed Users will find this to be a comprehensive and updated review on insect metamorphosis covering biological physiological and molecular facets with an emphasis on evolutionary aspects
