Alan Stern, Jeffrey M. Moore, William M. Grundy, Leslie A. Young, Richard P. Binzel, 2021-08-10 Once perceived as distant cold dark and seemingly unknowable Pluto had long been marked as the farthest and most unreachable frontier for solar system exploration The Pluto System After New Horizons is the benchmark research compendium for synthesizing our understanding of the Pluto system This volume reviews the work of researchers who have spent the last five years assimilating the data returned from New Horizons and the first full scientific synthesis of this fascinating system      **Physis, Biopower, and Biothermodynamics** Enrique Leff, 2024-04-16 Building upon the idea that our current environmental question arises from the history of metaphysics which privileged thought about Being or ontology over the conditions of life this book reinterprets Heraclitus's notion of physis as the fundamental emergent potency of life as the category to be thought by thinkers In so doing it deconstructs the interpretation offered by Heidegger and so stresses the struggle between the

creative force of life and its subjection to the human Logos or meaning Physis understood as the pre ontological potentiality of life itself thus becomes the cornerstone of a materialist philosophy of life Following engagements with the work of Nietzsche Foucault and Janicaud to explore the significance of human intervention into the realm of life via the will to power biopower and the power of rationality respectively the author explores twentieth century rearticulations of the concept of physis through a range of developments in biothermodynamics thus grounding a new philosophy of life and a new bioeconomics in a revisited biothermodynamics centered on the concept of negentropy An extensive engagement with the history and development of thought about the generative force of life on Earth Physis Biopower Biothermodynamics and Bioeconomics The Fire of Life will appeal to scholars of philosophy social theory and political theory with interests in environmental thought political ecology and questions of sustainability

*Climate of the Past, Present and Future* Javier Vinós, 2022-09-20 This book is an unorthodox ground breaking scientific study on natural climate change and its contribution to ongoing multi centennial global warming The book critically reviews the effect of the following on climate Milankovitch cycles abrupt glacial Dansgaard Oeschger events Holocene climate variability the

1500 year cycle solar activity volcanic eruptions greenhouse gases energy transport Applying the scientific method to available evidence reveals that some of these phenomena are profoundly misunderstood by most researchers Milankovitch cycles are tied to orbital obliquity not to orbital precessional summer insolation glacial megatides might have triggered abrupt Dansgaard Oeschger events and tides are likely responsible for the related 1500 year climate cycle Climate change affects volcanic eruptions more than the opposite and secular variations in solar activity are more important to climate change during the Holocene than greenhouse gases In this book we see how important natural climate change has been on human societies of the past It also produces new climate projections for the 21st century and when the next glaciation could happen What emerges from this study of natural climate change is a central theme Variations in the transport of energy from the tropics to the poles have been neglected as a cause of climate change and solar activity variations affect climate by modulating this transport The author tells us Transporting more energy from a greenhouse gas rich region the tropics to a greenhouse gas poor region the poles increases the amount of energy lost at the top of the atmosphere The effect resembles a reduction in the greenhouse gas content The book presents the Winter Gatekeeper Hypothesis on how variations in solar activity regulate Earth's energy transport and in so doing affect atmospheric circulation the rotation of the planet and the El Niño Southern Oscillation This book is oriented toward students and academics in the climate sciences and climate anthropology and should also appeal to readers interested in the science of natural climate change The repercussions of Climate of the Past Present and Future are far reaching By uncovering a strong natural climate change component it provides a novel view of anthropogenic climate change fossil energy use and our future climate a view quite different from the IPCC's gloomy projections

Deep Earth Hidenori Terasaki, Rebecca A. Fischer, 2016-04-04 Deep Earth Physics and Chemistry of the Lower Mantle and Core highlights recent advances and the latest views of the deep Earth from theoretical experimental and observational approaches and offers insight into future research directions on the deep Earth In recent years we have just reached a stage where we can perform measurements at the conditions of the center part of the Earth using state of the art techniques and many reports on the physical and chemical properties of the deep Earth have come out very recently Novel theoretical models have been complementary to this breakthrough These new inputs enable us to compare directly with results of precise geophysical and geochemical observations This volume highlights the recent significant advancements in our understanding of the deep Earth that have occurred as a result including contributions from mineral rock physics geophysics and geochemistry that relate to the topics of I Thermal structure of the lower mantle and core II Structure anisotropy and plasticity of deep Earth materials III Physical properties of the deep interior IV Chemistry and phase relations in the lower mantle and core V Volatiles in the deep Earth The volume will be a valuable resource for researchers and students who study the Earth's interior The topics of this volume are multidisciplinary and therefore will be useful to students from a wide variety of fields in the Earth Sciences
