Abstract. The paper describes a Trnsys model of real solar heat pump system in Slatiňany, Czech Republic. The model was based on output data from the monitoring system for the year 2011 (solar irradiation, ambient temperature, heat consumption). The output data from the computed model were compared to the values recorded by a monitoring system.

Introduction

The article aims to describe a model of long-term heat storage created in the TRNSYS simulation tool [1]. The model simulates a real system installed in Slatiňany (Czech Republic) in 1996. The output data from the computed model were compared to real values recorded by a monitoring system. The model was created to facilitate optimisation of the system.

System description

The system provides space heating and hot water for sheltered workshops of the Social Care Home in Slatiňany. During the summer, heat gain from the solar collector field installed at the roof of the building (absorber area 147.8 m^2) is stored in a long-term heat storage tank. The steel non-pressure water storage tank (usable volume 1083 m^3) is located outside the building and insulated by mineral wool (700 mm). During the winter, when the amount of solar radiation is limited, the energy from the long-term heat storage tank is used for space heating in the building (water floor heating, heat loss of the building is 57 kW at $\theta_c = -15 \text{ }^\circ\text{C}$) [2], see Fig. 1.

Fig. 1 – System diagram, description of key parts and measurement points of system monitoring.

If the temperature in the long-term heat storage tank is sufficient (over ca $36 \text{ }^\circ\text{C}$ based on heating curve), the building is heated directly using the water from the tank which enters the underfloor heating system over two buffer tanks. The water from the long-term heat storage tank is taken near the surface or from the middle of the tank and return water flows in at the bottom. At lower

Marletta,2021-09-08 This book provides the reader with an understanding of the impact that different morphologies construction materials and green coverage solutions have on the urban microclimate thus affecting the comfort conditions of urban inhabitants and the energy needs of buildings in urban areas The book covers the latest approaches to energy and

outdoor comfort measurement and modelling on an urban scale and describes possible measures and strategies to mitigate the effects of the mutual interaction between urban settlements and local microclimate Despite its relevance only limited literature is currently devoted to appraising from an engineering perspective the intertwining relationships between urban geometry and fabrics energy fluxes between buildings and their surroundings outdoor microclimate conditions and building energy demands in urban areas This book fills this gap by first discussing the physical processes that govern heat and mass transfer at an urban scale while emphasizing the role played by different spatial arrangements manmade materials and green infrastructures on the outdoor microclimate The first chapters also address the implications of these factors on the outdoor comfort conditions experienced by pedestrians and on the buildings energy demand for space heating and cooling Then based upon cutting edge experimental activities and simulation work this book demonstrates current and forthcoming adaptation and mitigation strategies to improve the urban microclimate and its impact on the built environment such as cool materials thermochromic and retroreflective finishing materials and green infrastructures applied either at a building scale or at the urban scale The effect of these solutions is demonstrated for different cities worldwide under a range of climate conditions Finally the book opens a wider perspective by introducing the basic elements that allow fuel poverty raw materials consumption and the principles of circular economy in the definition of a resilient urban settlement

Thermal Systems

Ivan CK Tam, Brian Agnew, 2021-04-07 We live in interesting times in which life as we know it is being threatened by manmade changes to the atmosphere in which we live On the global scale concern is focused on climate change due to greenhouse gas emissions and on a national scale atmospheric pollution produced by combustion processes is of concern A possible approach is through the development of new ideas and innovative processes to the current practices Among the available options multi generation processes such as the trigeneration cycle battery storage system solar power plants and heat pumps have been widely studied as they potentially allow for greater efficiency lower costs and reduced emissions On the other hand some researchers had been working to increase the potential of energy generation process through heat recovery under the steam generator organic Rankine cycle and absorption chillers In this Special Issue on Thermal Systems of fundamental or applied and numerical or experimental investigation many new concepts in thermal systems and energy utilization were explored and published as original research papers in this Special Issue

Designing Zero Carbon

Buildings Using Dynamic Simulation Methods Ljubomir Jankovic, 2013-07-03 As we increasingly become aware of the causes and consequences of the climate change there is a sense that we are dealing with an almost impossible problem to solve that our targets for zero carbon buildings are far in the future and that our targets are hard to achieve This book develops a structured method for zero carbon design and demonstrates that it is perfectly possible to design new or retrofit zero carbon buildings today using existing technologies Dynamic simulation is an essential ingredient of this method and a pre requisite for the level of analysis and optimization that is needed in order to achieve zero carbon design The second

essential ingredient is the economic analysis and the book demonstrates how zero carbon designs can be optimised to result in lucrative rates of return on investment The third essential ingredient is the achievement of thermal comfort The book argues that zero carbon living is not about a considerable change of behaviour but that it is about design that works with climate rather than against it that uses predominantly passive rather than active means for achieving thermal comfort and that is well tested integrated and optimised using dynamic simulation Using this method designers can start making a difference today This book therefore makes a case for change a change of our perceptions that we are dealing with an impossible problem to solve a change of our business and economic models and a change of our attitudes towards zero carbon design and zero carbon living
