It is a truly unique reference written to guide operators and engineers as an onsite consultant would.

Vacuum Deposition onto Webs, Films and Foils Charles Bishop, 2015-08-15 *Vacuum Deposition onto Webs, Films and Foils Third Edition* provides the latest information on vacuum deposition, the technology that applies an even coating to a flexible material that can be held on a roll, thereby offering a much faster and cheaper method of bulk coating than deposition onto single pieces or non flexible surfaces such as glass. This technology has been used in industrial scale applications for some time including a wide range of metalized packaging. Its potential as a high speed scalable process has seen an increasing range of new products emerging that employ this cost effective technology including solar energy products that are moving from rigid panels onto cheaper and more versatile flexible substrates, flexible electronic circuit boards and flexible displays. In this third edition, all chapters are thoroughly revised with a significant amount of new information added, including newly developed barrier measurement techniques, improved vacuum monitoring technologies and the latest developments in Atomic Layer Deposition (ALD). Provides the know how to maximize productivity of vacuum coating systems. Thoroughly revised with a significant amount of new information added, including newly developed barrier measurement techniques, improved vacuum monitoring technologies and the latest on Atomic Layer Deposition (ALD). Presents the latest information on vacuum deposition, the technology that applies an even coating to a flexible material that can be held on a roll, thereby offering a much faster and cheaper method of bulk coating. Enables engineers to specify systems more effectively and enhances dialogue between non specialists and suppliers. Engineers Empowers those in rapidly expanding fields such as solar energy, display panels and flexible electronics to unlock the potential of vacuum coating to transform their processes and products.

Roll-to-Roll Vacuum Deposition of Barrier Coatings Charles A. Bishop, 2015-08-28 It is intended that the book will be a practical guide to provide any reader with the

basic information to help them understand what is necessary in order to produce a good barrier coated web or to improve the quality of any existing barrier product After providing an introduction where the terminology is outlined and some of the science is given keeping the mathematics to a minimum including barrier testing methods the vacuum deposition process will be described In theory a thin layer of metal or glass like material should be enough to convert any polymer film into a perfect barrier material The reality is that all barrier coatings have their performance limited by the defects in the coating This book looks at the whole process from the source materials through to the post deposition handling of the coated material This holistic view of the vacuum coating process provides a description of the common sources of defects and includes the possible methods of limiting the defects This enables readers to decide where their development efforts and money can best be used to improve the barrier performance of their own process or materials The 2nd edition contains at least 20% new material including additional barrier testing techniques that have been developed and testing and cleaning equipment brought to market since the 1st edition was published in 2010 The topic of adhesion is covered in more detail and there is a section on the Hansen Solubility Parameter which is a method of predicting the solubility of gases or liquids in materials

Vanadium Dioxide-Based Thermochromic Smart Windows Yi Long, Yanfeng Gao, 2021-05-27 The usage of building energy accounts for 30-40% of total energy consumption in developed countries exceeding the amount for industry or transportation. Around 50% energy for building services is contributed by heating, ventilation and air conditioning (HVAC) systems. More importantly, both building and HVAC energy consumptions are predicted to increase in the next two decades. Windows are considered as the least energy efficient components of buildings. Therefore, smart windows are becoming increasingly important as they are capable of reducing HVAC energy usage by tuning the transmitted sunlight in a smart and favoured way, blocking solar irradiation on hot days while letting it pass through on cold days. Compared with other type of smart windows, thermochromic windows have the unique advantages of cost effectiveness, rational stimulus and passive response. This book covers fabrication of vanadium dioxide based smart windows, discusses various strategies to enhance their performance and shares perspectives from the top scientists in this particular field.
