Materials Josef Krautkrämer, Herbert Krautkrämer, 1969 *Industrial Radiology* R. Halmshaw, 1995-09-30 Industrial radiography is a well established non destructive testing NDT method in which the basic principles were established many years ago However during 1993 95 the European Standards Organisation CEN commenced drafting many new standards on

NDT including radiographic methods and when completed these will replace national standards in all the EC member countries In some cases these standards vary significantly from those in use in the UK at present These CEN standards are accepted by majority not unanimous voting so they will become mandatory even in countries which vote against them As most are likely to be legal by the time this second edition is published they are described in the appropriate places in the text The most important new technical development is the greater use of computers in radiology In the first edition computerized tomography was only briefly mentioned at the end of Chapter 11 as it was then largely a medical method with only a few equipments having found a place in industrial use The method depends on a complex computer program and a large data store Industrial equipments are now being built although their spread into industry has been slow Computer data storage is also being used for radiographic data Small computers can now store all the data produced by scanning a radiographic film with a small light spot and various programs can be applied to these data
