UML Modelling for Business Analysts Sandeep Desai, Abhishek Srivastava, 2018-11-21. UML modelling is one of the widely used techniques in the software development industry. Business analysts use this technique to develop the requirements to make it suitable for the technology team and customers alike. After spending several years in the IT industry, we have realized that requirements or incomplete or incorrect understanding of the requirements have been one of the primary reasons for the failure of the software projects. This has been proven time again by the CHAOS report published by Standish Group. So the motivation to write this book is to provide a comprehensive, detailed and practical guide on requirements development to enable every business analyst conduct this phase efficiently. This book deals with requirements development and its sub-phases with examples and case studies. We have selected UML diagrams as the modelling technique to explain and guide you through the entire process. Requirements development phase comprises of multiple steps comprising of Requirements Elicitation, Requirements analysis and modelling, Requirements specification and validation. Chapter 1 and 2 lay the foundation for the entire book. Chapter 1 provides fundamentals of software development life cycle methodology. Chapter 2 provides the basics of requirements development process in the overall context of SDLC. As the focus is on UML modelling, chapter 3 to chapter 8 deals with UML modelling. Chapter 9 deals with the requirements specifications and validation. We have presented complete requirements specification document in two formats: System Requirements specification (SRS) document, Use case specification document. We have also discussed structured analysis and design (SAD) methodology in the Appendix. We have also used two case studies in addition to examples to explain the concepts practically.

The Art of Business Process Modeling Martin Schedlbauer,2010 Information systems have become a critical part of the infrastructure of most if not all businesses government organizations and even individual households To be useful an information system must integrate and align with the way the business conducts its operations By necessity this means that information systems construction requires an understanding of the organization s procedures operations and processes Articulating modeling and managing business processes and workflows are pre conditions to successful automation Business processes are part of the fabric of the business and represent a strategic and critical intellectual asset that needs to be understood and proactively managed Processes are often cross functional and involve multiple systems software applications and human assets including employees customers partners and vendors Processes must be formally defined and documented so that they can be practiced uniformly and consistently across the organization Explicit articulation of processes is essential so that the processes truly become intellectual property of the organization rather than being tied to a specific individual Business process modeling or BPM for short is the activity of eliciting documenting modeling and analyzing work procedures within an organization To be successful the business analyst must possess the necessary modeling skills and business knowledge to carry out these responsibilities The first step in business process management is capturing and articulating the processes This is done through process modeling Once processes have been documented then the organization can think about optimizing and eventually automating the processes Optimization is done through a combination of manual analysis as well as automated simulation This book describes the PROMAP methodology for articulating and modeling business processes PROMAP is practical and based on over 20 years of experience in modeling
