Conference on Future Automotive Technology Markus Lienkamp,2012-12-09 The increasing trend towards electric cars leads to several challenges for the automobile industry research institutes and politics as well as for the society Research and serial development move closer together to meet automotive standards with new components like traction batteries integrated into hybrid and electrical drivetrains Furthermore the influence of e mobility on the daily mobility behavior the effects on the automotive supply chain and the impact on industrial production have to be taken into account According to

these complex aspects it is crucial to not only acquire specific knowledge in the particular fields but also to consider their functional interaction. Therefore it seems essential to merge competence from science, economy and politics. This year the annual Conference on Future Automotive Technology as the follow up of the 2. Automobiltechnisches Kolloquium München focuses on the economical realization of widespread automotive electromobility. **CIRP Design 2012** Amaresh Chakrabarti, 2012-11-27. During its life cycle a product produces waste that is over 20 times its weight. As such it is critical to develop products that are sustainable. Currently product development processes lack high quality methods and tools that are empirically validated to support development of sustainable products. This book is a compilation of over forty cutting edge international research papers from the 22nd CIRP International Design Conference written by eminent researchers from 15 countries on engineering design process methods and tools broadly for supporting sustainable product development. A variety of new insights into the product development process as well as a host of methods and tools that are at the cutting edge of design research are discussed and explained covering a range of diverse topics. The areas covered include Sustainable design and manufacturing, Design synthesis and creativity, Global product development and product life cycle management, Design for X, safety, reliability, manufacturability etc. and Design taxonomy, ontology and standards. **CIRP Design 2012 Sustainable Product Development** provides researchers in design engineering and sustainability access to some of the latest quality research in this area. Practitioners and educators of engineering design and sustainability will find an empirically validated suite of methods and tools that can be applied and taught to develop their practices. *Exploration of the Influence of Additive Manufacturing Design Potentials on Vehicle Conception* Daniel Fuchs, 2015-11-03. In this Open Access book Daniel Fuchs analyzes the potential impact of additive manufacturing related design freedom on vehicle conception. In this context the term Additive Manufacturing (AM) incorporates the technology field often referred to as 3D Printing. The motivation for this work is derived from alternative design solutions presented in state of the art AM use cases in which additional design freedom is leveraged to achieve significant product and process related improvements. This book systematically explores the impact of AM related design freedom on vehicle conception leveraging novel design potentials from the part to the complete vehicle level. *Load Assumption for Fatigue Design of Structures and Components* Michael Köhler, Sven Jenne, Kurt Pötter, Harald Zenner, 2017-06-07. Understanding the fatigue behaviour of structural components under variable load amplitude is an essential prerequisite for safe and reliable light weight design. For designing and dimensioning the expected stress load is compared with the capacity to withstand loads (fatigue strength). In this process the safety necessary for each particular application must be ensured. A prerequisite for ensuring the required fatigue strength is a reliable load assumption. The authors describe the transformation of the stress and load time functions which have been measured under operational conditions to spectra or matrices with the application of counting methods. The aspects which must be considered for ensuring a reliable load assumption for designing and dimensioning are discussed in detail. Furthermore the theoretical

background for estimating the fatigue life of structural components is explained and the procedures are discussed for numerous applications in practice One of the prime intentions of the authors is to provide recommendations which can be implemented in practical applications

Algorithm Concept for Crash Detection in Passenger Cars André Leschke, 2020-03-18 State of the art airbag algorithms make a decision to fire restraint systems in a crash by evaluating the deceleration of the entire vehicle during the single events of the accident In order to meet the ever increasing requirements of consumer test organizations and global legislators a detailed knowledge of the nature and direction of the crash would be of great benefit The algorithms used in current vehicles can only do this to a limited extent Andr Leschke presents a completely different algorithm concept to solve these problems In addition to vehicle deceleration the chronological sequence of an accident and the associated local and temporal destruction of the vehicle are possible indicators for an accident s severity About the Author Dr Andr Leschke has earned his doctoral degree from Tor Vergata University of Rome Italy Currently he is working as head of a team of vehicle safety developers in the German automotive industry
