recent decades there has been a growing awareness of how intricate the interactions are between human beings and the environment. Fortunately, progress has been made in understanding this relationship and new technologies have been effective in addressing environmental problems. However, belatedly, there has been an acknowledgment of the incompatibility of the world's finite resources with humankind's increasingly greater needs for them and of how such a challenge demands broadened collaboration among engineers, social scientists, politicians, and financial powers. Global agreement that the essential issues of the twenty-first century cannot be solved by any one discipline has led to the concept of sustainability. The transdisciplinary contributions selected for inclusion in this book address these concerns with an overview of the diverse fields of study related to sustainability. This collection of work is intended to pave the way for further collaboration among scientists and nations as well.

Climate Change 2001: The Scientific Basis is the most comprehensive and up-to-date scientific assessment of past, present, and future climate change. The report analyses an enormous body of observations of all parts of the climate system, catalogues increasing concentrations of atmospheric greenhouse gases, assesses our understanding of the processes and feedbacks which govern the climate system, projects scenarios of future climate change using a wide range of models of future emissions of greenhouse gases and aerosols, makes a detailed study of whether a human influence on climate can be identified, suggests gaps in information and understanding that remain in our knowledge of climate change and how these might be addressed. This latest IPCC assessment will again form the standard scientific reference for all concerned with climate change and its consequences, including students and researchers in all aspects of environmental and atmospheric science and policymakers in governments and industry worldwide.
