These authors also note that the use of the term "cognitive" is not always appropriate, as it can be used to describe a wide range of mental processes, from simple perception to complex reasoning. They argue that the term "cognitive" should be used to describe processes that are directly related to the formation and use of knowledge, and that it should not be used to describe processes that are more general or more abstract. They also note that the term "cognitive" is often used in a way that is inconsistent with its original meaning, and that it is important to be clear about what is meant by the term when it is used in a technical context.

These results suggest that the use of a single, standardized, and validated instrument to assess the prevalence of mental health problems in the community is a feasible and reliable method. The use of such an instrument would allow for the comparison of results across different studies and populations, and would facilitate the identification of risk factors for mental health problems. The use of a single, standardized, and validated instrument would also facilitate the development of targeted interventions to reduce the prevalence of mental health problems in the community.
