Aviation Automation Charles E. Billings, 2018-01-29 The advent of very compact very

powerful digital computers has made it possible to automate a great many processes that formerly required large complex machinery. Digital computers have made possible revolutionary changes in industry, commerce, and transportation. This book is an expansion and revision of the author's earlier technical papers on this subject. It describes the development of automation in aircraft and in the aviation system, its likely evolution in the future, and the effects that these technologies have had and will have on the human operators and managers of the system. It suggests concepts that may be able to enhance human-machine relationships in future systems. The author focuses on the ability of human operators to work cooperatively with the constellation of machines they command and control, because it is the interactions among these system elements that result in the system's success or failure, whether in aviation or elsewhere. Aviation automation has provided great social and technological benefits, but these benefits have not come without cost. In recent years, new problems in aircraft have emerged due to failures in the human-machine relationship. These incidents and accidents have motivated this inquiry into aviation automation. Similar problems in the air traffic management system are predicted as it becomes more fully automated. In particular, incidents and accidents have occurred which suggest that the principal problems with today's aviation automation are associated with its complexity, coupling, autonomy, and opacity. These problems are not unique to aviation; they exist in other highly dynamic domains as well. The author suggests that a different approach to automation, called human-centered automation, offers potential benefits for system performance by enabling a more cooperative human-machine relationship in the control and management of aircraft and air traffic.

Code/Space Rob Kitchin, Martin Dodge, 2014-01-10. An analysis of the ways that software creates new spatialities in everyday life, from supermarket checkout lines to airline flight paths. After little more than half a century since its initial development, computer code is extensively and intimately woven into the fabric of our everyday lives. From the digital alarm clock that wakes us to the air traffic control system that guides our plane in for a landing, software is shaping our world. It creates new ways of undertaking tasks, speeds up and automates existing practices, transforms social and economic relations, and offers new forms of cultural activity, personal empowerment, and modes of play. In *Code/Space*, Rob Kitchin and Martin Dodge examine software from a spatial perspective, analyzing the

dyadic relationship of software and space The production of space they argue is increasingly dependent on code and code is written to produce space Examples of code space include airport check in areas networked offices and caf s that are transformed into workspaces by laptops and wireless access Kitchin and Dodge argue that software through its ability to do work in the world transduces space Then Kitchin and Dodge develop a set of conceptual tools for identifying and understanding the interrelationship of software space and everyday life and illustrate their arguments with rich empirical material And finally they issue a manifesto calling for critical scholarship into the production and workings of code rather than simply the technologies it enables a new kind of social science focused on explaining the social economic and spatial contours of software
