For the purpose of this study, a sample of 1000 individuals was selected from the population of the city of Bogotá, Colombia. The sample was selected using a simple random sampling method. The sample size was determined using the formula for a simple random sample, which is $n = \frac{Z^2 \cdot p \cdot q}{E^2}$, where n is the sample size, Z is the Z-score, p is the population proportion, q is the population proportion, and E is the margin of error. The Z-score for a 95% confidence level is 1.96. The population proportion p was assumed to be 0.5, and the margin of error E was assumed to be 0.05. The sample size was calculated to be 384.1, which was rounded up to 385.

Pharmaceutical companies have a lot of incentives to spend their time and money on drugs that will be profitable, rather than on drugs that are the most useful or that would have the greatest potential to benefit society. For example, the pharmaceutical industry has spent a lot of money on drugs that are used to treat chronic diseases, such as heart disease, diabetes, and cancer, but it has not spent as much on drugs that are used to treat acute diseases, such as flu, cold, and sore throat. This is because chronic diseases are more profitable than acute diseases, and the pharmaceutical industry is a for-profit industry.
