FORMATION OF THE SOLAR SYSTEM
Reading Comprehension

Name: _____

(1) Billions of years ago, astronomical events laid out the frame upon the other planets in our Solar System to form. This process theory is a scientific explanation for the formation of our solar system. It proposes that the sun, planets, and other celestial bodies of our solar system formed from a rotating cloud of gas and dust. This theory was first proposed by the French mathematician and astronomer Pierre Simon Laplace in the 18th century.

(2) According to the nebular theory, the process of solar system formation began in a 4 billion year span with the gravitational collapse of a massive rotating cloud of gas and dust called a solar nebula. At some point, the solar nebula collapsed in on itself inwardly caused by the attraction of a nearby supernova. As the solar nebula contracted, it started to rotate faster due to the conservation of angular momentum. This spinning motion caused the cloud to flatten into a spinning disk known as the protoplanetary disk.

(3) Within the protoplanetary disk, the materials began to clump together due to gravitational forces, eventually forming a protostar. At protostar is a contracting mass of gas which represents an early stage in the formation of a star. Before nuclear fusion begins. Over time, the pressure at the center of the solar nebula grew hotter and denser, eventually igniting nuclear fusion and heat that the sun was born.

(4) The remaining particles and dust within the protoplanetary disk, cooled and stuck together through a process known as accretion. This accretion of materials eventually created irregularly shaped bodies called planetesimals. For the planetesimals continued accretion materials and grew in size. Their gravitational pull became stronger, allowing them to attract even more material from the disk. Eventually, these growing planetesimals became protoplanets, which continued to accumulate even more material and grew in size. These planetesimals continued to grow by attracting more material from the disk until they became large enough to be classified as planets.

(5) The nebular theory provides a scientific explanation for the observed similarities between the planets and the sun in the same system, and distances from the sun, and by various planes of reference. From similar disk structures, the theory and observations also suggest some commonalities between the planets and the sun.
