An Equilibrium Pricing Model for Weather Derivatives Yongheon Lee, 2008 Risk, 2002 *Modelling Prices in Competitive Electricity Markets* Derek W. Bunn, 2004-04-02 Electricity markets are structurally different to other commodities and the real time dynamic balancing of the electricity network involves many external factors Because of this it is not a simple matter to transfer conventional models of financial time series analysis to wholesale electricity prices The rationale for this compilation of chapters from international authors is therefore to provide econometric analysis of wholesale power markets around the world to give greater understanding of their particular characteristics and to assess the applicability of various methods of price modelling Researchers and professionals in this sector will find the book an invaluable guide to the most important state of the art modelling techniques which are converging to define the special approaches necessary for unravelling and forecasting the behaviour of electricity prices It is a high quality synthesis of the work of financial engineering industrial economics and power systems analysis as they relate to the behaviour of competitive electricity markets

Boensch, 2007-08 Research Paper undergraduate from the year 2006 in the subject Business economics Investment and Finance grade 1.7 University of Applied Sciences Essen course Case study in the core subject International Management Risk Management language English abstract The ability to hedge price risks of industrial and consumer goods is well developed and widely used but for many customers and companies a variance in the unit volume being caused by an unexpected weather situation can be as detrimental to the bottom line as unit price variation In the past market participants were exposed defencelessly to this risk because weather has been anything but predictable There was a bundle of incidents in the late 90s which led to the development of weather derivatives as a new flexible instrument to mitigate risk resulting from weather First the changing world climate causes more often extreme weather situations such as El Niño Weather catastrophes like the hurricanes Katrina and Rita in the USA summer flood of 2002 and the desert summer of 2003 in Germany have been increasing the awareness of weather risks among the population and in the management of the companies Unforeseen weather conditions may cause a decline in companies earnings It is likely to imagine that for example a cold and rainy summer will lead to a plummeting consumption of ice cream In times of an upward tending importance of the shareholder value approach a professional and effective risk management is inalienable Insurance policies can cover catastrophic

damages but derivatives are an efficient tool to face financial risks resulting from the weather and to stabilize earnings Secondly the worldwide markets are changing Formerly strictly regulated markets show an ongoing trend of deregulation and therefore a development from monopolies to wholesale markets Facing a new competitive situation companies have to realize that it does not last to hedge the unit price of their go **Business International Money Report** ,2004
