and plasmonics as well as those just entering this exciting new field. It surveys different types of structured surfaces their design and fabrication their unusual optical properties recent experimental observations and their applications. Each chapter is written by an expert in that area giving the reader an up to date overview of the subject. Both the experimental and theoretical aspects of each topic are presented.

Diffuse Waves in Complex Media Jean-Pierre Fouque, 2012-12-06. The NATO Advanced Study Institute on Diffuse Waves in Complex Media was held at the Centre de Physique des Houches in France from March 17 to 27 1998. The School's scientific content: wave propagation in heterogeneous media has covered many areas of fundamental and applied research. On the one hand the understanding of wave propagation has considerably improved during the last thirty years. New developments and concepts such as speckle correlations weak and strong localization time reversal near field propagation are under active research. On the other hand wave propagation in random media is now being investigated in many different fields such as applied mathematics acoustics optics atomic physics geophysics or medical sciences. Each community often uses its own language to describe the same phenomena. The aim of the School was to gather worldwide specialists to illuminate various aspects of wave propagation in random media. This volume presents fourteen expository articles corresponding to courses and seminars given during the School. They are arranged as follows: The first three articles deal with the phenomena of localization of waves. B. van Tiggelen p. 1 gives a critical review of the physics of localization. J. Lacroix p. 61 presents the mathematical theory and A. Klein p. 73 describes recent results for randomized periodic media. □□□□□□□□□□, 1996.
