

sleeve, and contact breaker lead.

3. Remove the contact adjusting screw, then lift the unit out.

INSTALLATION

Installation is a reversal of the removal procedure. Do not forget to install the fiber washer that fits between the moving point spring and the fixed point backing plate.

GAP ADJUSTMENT

1. Put the transmission in gear and rotate the engine by turning the rear wheel until the nylon heel of the contact breaker is aligned with the scribed mark on the breaker cam.

2. Loosen the contact adjusting screw and turn the eccentric screw until a snug slip-fit is obtained with the appropriate feeler gauge.

3. Tighten the adjusting screw and recheck the gap.

500 (Before H57083)

The point assembly is located behind a circular cover plate on the right side of the engine, and is driven off the right exhaust camshaft.

REMOVAL

1. Remove the points cover and gasket.

2. Remove the two sleeve nuts ("A" in the illustration), withdraw the points and condenser, and carefully disconnect the primary wire.

3. Remove the contact adjusting screw and turn the eccentric screw until a snug slip-fit is obtained with the appropriate feeler gauge.

INSTALLATION

Installation is the reverse of removal. Add a drop of motor oil to the point pivots before refitting.

GAP ADJUSTMENT

1. Remove the spark plugs.

2. Rotate the engine until the nylon heel of one set of points aligns with the

mark scribed on the breaker cam.

3. Insert the appropriate feeler gauge and, if necessary, loosen sleeve nuts "A" (see illustration) and shift the breaker point plate until a snug slip-fit is achieved.

4. Repeat the above for the other set of points.

5. Check to make sure the breaker plate is correctly positioned. The set of points with the black/yellow lead should be situated toward the rear. Also make certain that the pillar bolts are in the center of their adjustment slots.

500 (H57083 and Later), 650, 750 Twin

The points are beneath a cover plate on the right, front side of the engine.

REMOVAL

1. Remove the cover plate.

2. Remove the primary wire terminal nut, and disconnect the wire, noting any insulators and their positions.

3. Remove the contact locking screw and remove the points.

INSTALLATION

Installation is the reverse of removal. Lubricate the pivot with a drop of oil. Note wire connections.

GAP ADJUSTMENT

1. Turn the engine over until the scribed mark on the breaker cam aligns with the nylon heel of one of the points.

2. Check the gap with the proper feeler gauge. It should be a snug slip-fit if correct. If adjustment is necessary, loosen the contact locking screw, and turn the contact eccentric adjusting screw until the gap is correct. Tighten the locking screw and recheck gap.

3. Repeat the procedure with the other set of points.

T150, T150V

The procedure for removal, installation, and gapping is the same as outlined for 650 and 750 Twins, above, except that three sets of points must be gapped. Note wire color codes by referring to the accompanying illustration.

IGNITION TIMING

NOTE: Points should be cleaned and gapped before setting ignition timing.

INITIAL PROCEDURE

Before actually setting static timing, the piston must be located at the specified number of degrees before top dead center and the automatic spark advance mechanism must be locked in the fully advanced position.

1. Remove the small inspection cover at the front of the primary chaincase.

2. As can be seen through the aperture, a timing mark is scribed on the face of the alternator rotor and a pointer is mounted at the bottom of inspection hole.

3. Rotate the engine until it is on its compression stroke (i.e., both valves closed), then align the rotor mark and pointer. The piston is now located 37° before top dead center.

4. An alternate method of locating the piston, only possible on later machines, is by using Triumph special plunger and body (no. 61-2915 and 61-D572). Locate the piston on its compression stroke, then rotate the engine gently backward while applying slight pressure to the plunger. The plunger will drop into position, locking the piston at 37° before top dead center.

5. Now that the piston is correctly located, the automatic advance unit must be locked in the fully advanced position. This is necessary because, due to manufacturing tolerances, slight variation in spark timing will occur at one end of the advance curve or the other. In general, it is preferred that this variation does not affect high speed performance; therefore the mechanism should be set at the fully advanced position so that any fluctuations will occur only at idle speeds.

6. Carefully remove the cam central bolt and fit an extra washer on the bolt.
