Basic Transport Phenomena in Materials

Engineering Manabu Iguchi,Olusegun J. Ilegbusi,2013-09-12 This book presents the basic theory and experimental techniques of transport phenomena in materials processing operations Such fundamental knowledge is highly useful for researchers and engineers in the field to improve the efficiency of conventional processes or develop novel technology Divided into four parts the book comprises 11 chapters describing the principles of momentum transfer heat transfer and mass transfer in single phase and multiphase systems Each chapter includes examples with solutions and exercises to facilitate students learning Diagnostic problems are also provided at the end of each part to assess students comprehension of the material The book is aimed primarily at students in materials science and engineering However it can also serve as a useful reference text in chemical engineering as well as an introductory transport phenomena text in mechanical engineering In addition researchers and engineers engaged in materials processing operations will find the material useful for the design of experiments and mathematical models in transport phenomena This volume contains unique features not usually found in traditional transport phenomena texts It integrates experimental techniques and theory both of which are required to adequately solve the inherently complex problems in materials processing operations It takes a holistic approach by considering both single and multiphase systems augmented with specific practical examples There is a discussion of flow and heat transfer in microscale systems which is relevant to the design of modern processes such as fuel cells and compact heat exchangers Also described are auxiliary relationships including turbulence modeling interfacial phenomena rheology and particulate systems which are critical to many materials processing operations Single Crystal Growth of Semiconductors from Metallic Solutions Sadik Dost,Brian Lent,2006-11-17 Single Crystal Growth of Semiconductors from Metallic Solutions covers the four principal growth techniques currently in use for the growth of semiconductor single crystals from metallic solutions Providing an in depth review of the state of the art of each both experimentally and by numerical simulations The importance of a close interaction between the numerical and experimental aspects of the processes is also emphasized Advances in the fields of electronics and opto electronics are hampered by the limited number of substrate materials which can be readily produced by melt growth techniques such as the Czochralski and Bridgman methods This can be alleviated by the use of alternative growth techniques and in particular growth from metallic solutions The principal techniques currently in use are Liquid Phase Epitaxy Liquid Phase Electroepitaxy the Travelling Heater Method and Liquid Phase Diffusion Single Crystal Growth of Semiconductors from Metallic Solutions will serve as a valuable reference tool for researchers and graduate and senior undergraduate students in the field of crystal growth It covers most of the models developed in recent years The detailed development of basic and constitutive equations and the associated interface and boundary conditions

given for each technique will be very valuable to researchers for the development of their new models Describes the fundamentals of crystal growth modelling Providing a state of the art description of the mathematical and experimental growth processes Allows reader to gain clear insight into the practical and mathematical aspects of the topic

pioneers this set provides readers with the tools they need to answer the need for sustainable development faced by the industry The six volumes constitute a shift from the traditional mostly theoretical focus of most resources to the practical application of advances in research and development With con

Mathematical Simulation in Glass Technology Dieter Krause, Horst Loch, 2012-12-06 This book entitled Mathematical Simulation in Glass Technology is one of a series reporting on research and development activities on products and processes conducted by the Schott Group The scientifically founded development of new products and technical processes has traditionally been of vital importance to Schott and has always been performed on a scale determined by the prospects for application of our special glasses Since the reconstruction of the Schott Glaswerke in Mainz the scale has increased enormously The range of expert knowledge required could never have been supplied by Schott alone It is also a tradition in our company to cultivate collaboration with customers universities and research institutes Publications in numerous technical journals which since 1969 we have edited to a regular schedule as Forschungsberichte research reports describe the results of these cooperations They contain up to date information on various topics for the expert but are not suited as survey material for those whose standpoint is more remote This is the point where we would like to place our series to stimulate the exchange of thoughts so that we can consider from different points of view the possibilities offered by those incredibly versatile materials glass and glass ceramics We would like to share the knowledge won through our research and development at Schott in cooperation with the users of our materials with scientists and engineers interested customers and friends and with the employees of our firm
