Autocar ,1997 **Glossary - Automatic Belt Tensioner** Belt Drive (Automotive) Systems Committee,2021 This glossary was written to provide a consistent and uniform definition of terms used in describing an automatic belt tensioner as it applies to an automotive accessory drive system SAE J2198 has been reaffirmed to comply with the SAE Five Year Review policy **Analysis of Tensioner Induced Coupling in Serpentine Belt Drive Systems** Ryan Neward,2006 Serpentine belt drive systems are widely used in automobiles due to their compactness and long life These systems are composed of a belt a driving pulley driven pulleys and a spring loaded tensioner The driven pulleys may include such accessories as the alternator air conditioner or power steering pump Serpentine belt drives experience many different types of steady state motions and transient vibrations due to the different parameters in the system As a result of this it is important to create a mathematical model that allows the designer to extract information about the system such as the natural frequency and the mode shapes The accuracy of the model will depend primarily on the assumptions used In particular a key assumption is whether transverse and rotational motions of the belt are coupled due to the motion of the automatic belt tensioner This coupling is often neglected by authors who model only longitudinal belt response and in effect decouple the transverse and rotational motions Using a solution based upon coupled motion as well as a solution employing rotational motion only the importance of this coupling will be assessed Both solution results will be compared against published experimental data In addition a parametric study will be performed to determine the ability of the coupled and decoupled models to accurately predict changes in system natural frequencies and mode shapes due to changes in system parameters Abstract *Driver and passenger seat belt tensioner with air-bag control unit.* M.
