Vector Optimization With Infimum And Supremum:

Vector Optimization with Infimum and Supremum Andreas Löhne, 2011-05-25 The theory of Vector Optimization is developed by a systematic usage of infimum and supremum In order to get existence and appropriate properties of the infimum the image space of the vector optimization problem is embedded into a larger space which is a subset of the power set in fact the space of self infimal sets Based on this idea we establish solution concepts existence and duality results and algorithms for the linear case The main advantage of this approach is the high degree of analogy to corresponding results of Scalar Optimization The concepts and results are used to explain and to improve practically relevant algorithms for linear vector optimization problems

Recent Developments in Vector Optimization Qamrul Hasan Ansari, Jen-Chih Yao, 2011-09-21 We always come across several decision making problems in our daily life Such problems are always conflicting in which many different view points should be satisfied In politics business industrial systems management science networks etc one often encounters such kind of problems The most important and difficult part in such problems is the conflict between various objectives and goals In these problems one has to find the minimum or maximum for several objective functions Such problems are called vector optimization problems VOP multi criteria optimization problems or multi objective optimization problems This volume deals with several different topics aspects of vector optimization theory ranging from the very beginning to the most recent one It contains fourteen chapters written by different experts in the field of vector optimization

Variational Methods in Partially Ordered Spaces Alfred Göpfert, Hassan Riahi, Christiane Tammer, Constantin Zălinescu, 2023-12-08 In mathematical modeling of processes occurring in logistics management science operations research networks mathematical finance medicine and control theory one often encounters optimization problems involving more than one objective function so that Multiobjective Optimization or Vector Optimization initiated by W Pareto has received new impetus The growing interest in vector optimization problems both from the theoretical point of view and as it concerns applications to real world optimization problems asks for a general scheme which embraces several existing developments and stimulates new ones This book aims to provide the newest results and applications of this quickly growing field Basic tools of partially ordered spaces are discussed and applied to variational methods in nonlinear analysis and to optimization problems The book begins by providing simple examples that illustrate what kind of problems can be handled with the methods presented The book then deals with connections between order structures and topological structures of sets discusses properties of nonlinear scalarization functions and derives corresponding separation theorems for not necessarily convex sets Furthermore characterizations of set relations via scalarization are presented Important topological properties of multifunctions and new results concerning the theory of vector optimization and equilibrium problems are presented in the book These results are applied to construct numerical algorithms especially proximal point algorithms and geometric algorithms based on duality assertions In the second edition new sections about set less relations optimality conditions in set

optimization and the asymptotic behavior of multiobjective Pareto equilibrium problems have been incorporated Furthermore a new chapter regarding scalar optimization problems under uncertainty and robust counterpart problems employing approaches based on vector optimization set optimization and nonlinear scalarization was added Throughout the entire book there are examples used to illustrate the results and check the stated conditions This book will be of interest to graduate students and researchers in pure and applied mathematics economics and engineering A sound knowledge of linear algebra and introductory real analysis should provide readers with sufficient background for this book

Set-valued Optimization Akhtar A. Khan, Christiane Tammer, Constantin Zălinescu, 2014-10-20 Set valued optimization is a vibrant and expanding branch of mathematics that deals with optimization problems where the objective map and or the constraints maps are set valued maps acting between certain spaces Since set valued maps subsumes single valued maps set valued optimization provides an important extension and unification of the scalar as well as the vector optimization problems Therefore this relatively new discipline has justifiably attracted a great deal of attention in recent years This book presents in a unified framework basic properties on ordering relations solution concepts for set valued optimization problems a detailed description of convex set valued maps most recent developments in separation theorems scalarization techniques variational principles tangent cones of first and higher order sub differential of set valued maps generalized derivatives of set valued maps sensitivity analysis optimality conditions duality and applications in economics among other things
