Vein Pattern Recognition A Privacy Enhancing Biometric:

Vein Pattern Recognition Chuck Wilson, 2010-03-10 As one of the most promising biometric technologies vein pattern recognition VPR is quickly taking root around the world and may soon dominate applications where people focus is key Among the reasons for VPR's growing acceptance and use it is more accurate than many other biometric methods it offers greater resistance to spoofing it focuses

Biometric Security and Privacy Richard Jiang, Somaya Al-maadeed, Ahmed Bouridane, Prof. Danny Crookes, Azeddine Beghdadi, 2016-12-21 This book highlights recent research advances on biometrics using new methods such as deep learning nonlinear graph embedding fuzzy approaches and ensemble learning Included are special biometric technologies related to privacy and security issues such as cancellable biometrics and soft biometrics The book also focuses on several emerging topics such as big data issues internet of things medical biometrics healthcare and robot human interactions The authors show how these new applications have triggered a number of new biometric approaches They show as an example how fuzzy extractor has become a useful tool for key generation in biometric banking and vein heart rates from medical records can also be used to identify patients The contributors cover the topics their methods and their applications in depth

Biometrics in Identity Management Shimon K. Modi, 2011 In today's digital infrastructure we have to interact with an increasing number of systems both in the physical and virtual world Identity management IdM the process of identifying an individual and controlling access to resources based on their associated privileges is becoming progressively complex This has brought the spotlight on the importance of effective and efficient means of ascertaining an individual's identity Biometric technologies like fingerprint recognition face recognition iris recognition etc have a long history of use in law enforcement applications and are now transitioning towards commercial applications like password replacements ATM authentication and others This unique book provides you with comprehensive coverage of commercially available biometric technologies their underlying principles operational challenges and benefits and deployment considerations It also offers a look at the future direction these technologies are taking By focusing on

factors that drive the practical implementation of biometric technologies this book serves to bridge the gap between academic researchers and industry practitioners This book focuses on design development and deployment issues related to biometric technologies including operational challenges integration strategies technical evaluations of biometric systems standardization and privacy preserving principles and several open questions which need to be answered for successful deployments

The Future of Privacy Perri 6,1998 *Proceedings of the ... SICE Annual Conference* Keisoku Jidō Seigyo Gakkai (Japan). Gakujutsu Kōenkai,2004 Electronic Design , **Texture Based Hand Vein Pattern Recognition** Premalatha Kandhasamy,2017-04 With the increasing demand for security worldwide biometric recognition is becoming more and more important and with the improvements in computer vision and pattern recognition technologies it is becoming more usable as well Hand vein pattern is a biometric feature in which the actual pattern has the shape of the vein network and its characteristics are the vein features The main objective of this project work is to develop a personal recognition system based on hand dorsal vein pattern with a high recognition rate Hand vein biometrics offer higher security It is easy to acquire the hand vein image and very hard to forge the data compared to more established biometric verification methods with a comparable or improved recognition rate Weber local binary pattern WLBP consists of two components named differential excitation and Local Binary Pattern LBP The differential excitation extracts perception features by Weber's law and the LBP describe the local features By computing the two components the differential excitation image and the LBP image are extracted WLBP histogram is constructed using these two images HOG is a technique which counts occurrences of gradient orientation in localized portions of an image WLBP and HOG features are fused together and it is used for classifying the images The next section of the work computes the binary code string for every pixel of a given image by

means of natural image statistical filters The code value of the pixel considers the local descriptor of an image intensity values in the pixel's neighborhood The value of each bit binary code is calculated by binarizing the response of linear filter with a threshold at 0 Each bit is related with different filters and the preferred length of the binary code decides the number of filters used The most important method for image representation and analysis is the spatial frequency transformation which can be represented in terms of magnitude and phase Phase is highly invulnerable to noise and contrast distortions and it is an important feature desirable in image processing In the final section of the work the twelve bit code of the feature vector from 0 4095 is obtained using local Gaussian phase quantization and local Gabor phase quantization These codes for all image pixel neighborhoods are collected into histogram bins which can be used for hand vein image classification

Wall Street & Technology, 2008 **Palm Vein Recognition as Human Biometrics** Junwen Sun, 2017 A palm vein biometrics system is essentially a pattern recognition system that operates by acquiring an image of the palm veins extracting a feature set from the image and comparing this feature set against the template saved in a database Unlike other biometric technologies such as fingerprints or face recognition the palm vein scanner works by capturing the images of the vein patterns that are beneath the skin of the palm Thus palm vein based biometrics are more secure than fingerprints and palm prints Moreover the palm vein scanner captures the images of vein patterns in a contactless manner which makes it more sterile and hygienic to use However the palm prints are also available in the Near Infrared NIR illumination around 760nm wavelength In some multispectral palmprint databases the palmprint and palm vein images are both available in the same image In this thesis the features of both palm vein and palmprint are used for recognition The process of palm vein recognition can be divided into several stages image acquisition pre processing feature extraction matching and decision making In order to build a reliable and accurate system the unchangeable features of the palm prints veins must be efficiently extracted from the original image The difficulty of this problem combined with the development of hyperspectral imaging techniques has motivated the research presented in this thesis Line or linear prints veins detection have played an important part in palm prints vein recognition These techniques have been reviewed and explored However the vulnerability to the change of palm position and ambient illumination together with low accuracy encouraged researchers to find more stable algorithms Fourier transform wavelet transform and other frequency domain transforms are more robust and stable in palm prints veins recognition Due to the sparsity of the palm image which is usually composed of some prints and veins it is convenient to only transform the linear features to the frequency domain Thus in this thesis the Curvelet Transform is introduced to extract the curve like features from the palm print vein images for accurate and sparse representation The palm image is decomposed to several scales of coefficients while in each scale the coefficients represent different features of the palm image This technique can reduce the storage of the palm image to several hundred bytes and improve the accuracy as well In order to increase the recognition accuracy a combination of several biometrics features should be considered as

well The Curvelet Transform is good at extracting the curve like features for accurate and sparse representation while the Gabor Filter can preserve local orientations A combining scheme is proposed to utilise both of the two recognition methods at the same time with single near infrared palm image This combining scheme improves the recognition accuracy a lot compared with techniques with solely Curvelet Transform or Gabor Filter The experimental results demonstrate the effectiveness of the proposed method As we can get information more easily and more accurately the problem of information redundancy emerges especially in hyperspectral imaging As the number of palm images in the database increases more effective methods of categorizing palm veins and fast matching algorithms should be developed In hyperspectral palmprint recognition systems it s not convenient to use exhaustive search for the optimal band selection and combination A bands selection scheme is developed at the pre processing stage

Palm Veins Recognition and Verification System Asmaa M. J. Agha,Loay E. George,2014-09-23 During the last years hand vein patterns recognition is one of the most recent biometric technologies used for the identification verification of individuals The vein trace is hard to damaged changed or falsified since veins are internal to the human body In this work a novel palm vein recognition and verification system is presented The system work flow passes through two main phases i the enrollment phase and ii the recognition phase In the enrollment phase the biometric system is trained to identity a specific person While in the recognition phase the system tries to identify who is the person in case of identification or to verify is the person who he she claims to be in case of verification
