Cardiopulmonary Interactions in Acute Respiratory Failure J. L. Vincent, Peter M. Suter, 1987 In summary, the mechanical integration of ventricular and pulmonary actions is determined by a number of mechanisms including airway pressure, pleural and pericardial pressure, state of the interventricular septum, and others. After this brief review of essential features, we may discuss some aspects of the interactions between heart and lung function.

Influence of Intrathoracic Pressure: The Importance of Transmural Pressure It is established that blood pressure, volume, and flow rates in the lesser circulation change during each respiratory cycle. The effects of intrathoracic P_{it} and pleural P_{pi} pressures and lung volumes were recently described in terms of ventricular preload and afterload during normal breathing, hyperventilation, and the Valsalva and Muller maneuvers.^{4,7,8} Still, many aspects remain unsettled, mainly because of technical difficulties related to the simultaneous recording of floating respiratory and circulatory events in the intact animal or in man.⁹ Some confusion arises from the clinician's unawareness of the role played by the transmural pressure P_{tm} , being the pressure gradient between the lumen of a vessel or heart chamber and the surrounding tissues. P_{it} for the pulmonary arteries and veins, and P_{pe} for the heart. Yet an undetected change of P_{lm} may modify vascular caliber and resistance in the pulmonary district, regardless of any changes in vasomotor activity. Consequently, a change of vascular resistance concomitant with a change of P_{tm} is not a reliable index of pulmonary vasomotricity.
