Verifying Java Programs Grammar Approach:

Verifying Java Programs - A Graph Grammar Approach Jonathan Heinen, 2015 **Computer Aided Verification**

Hana Chockler, Georg Weissenbacher, 2018-07-20 This open access two volume set LNCS 10980 and 10981 constitutes the refereed proceedings of the 30th International Conference on Computer Aided Verification CAV 2018 held in Oxford UK in July 2018 The 52 full and 13 tool papers presented together with 3 invited papers and 2 tutorials were carefully reviewed and selected from 215 submissions The papers cover a wide range of topics and techniques from algorithmic and logical foundations of verification to practical applications in distributed networked cyber physical and autonomous systems They are organized in topical sections on model checking program analysis using polyhedra synthesis learning runtime verification hybrid and timed systems tools probabilistic systems static analysis theory and security SAT SMT and decisions procedures concurrency and CPS hardware industrial applications **String Analysis for Software Verification and Security** Tevfik

Bultan, Fang Yu, Muath Alkhalaf, Abdulbaki Aydin, 2018-01-04 This book discusses automated string analysis techniques focusing particularly on automata based static string analysis It covers the following topics automata bases string analysis computing pre and post conditions of basic string operations using automata symbolic representation of automata forward and backward string analysis using symbolic automata representation constraint based string analysis string constraint solvers relational string analysis vulnerability detection using string analysis string abstractions differential string analysis and automated sanitization synthesis using string analysis String manipulation is a crucial part of modern software systems for example it is used extensively in input validation and sanitization and in dynamic code and query generation The goal of string analysis techniques and this book is to determine the set of values that string expressions can take during program execution String analysis can be used to solve many problems in modern software systems that relate to string manipulation such as 1 Identifying security vulnerabilities by checking if a security sensitive function can receive an input string that contains an exploit 2 Identifying possible behaviors of a program by identifying possible values for dynamically generated code 3 Identifying html generation errors by computing the html code generated by web applications 4 Identifying the set of queries that are sent to back end database by analyzing the code that generates the SQL queries 5 Patching input validation and sanitization functions by automatically synthesizing repairs illustrated in this book Like many other program analysis problems it is not possible to solve the string analysis problem precisely i e it is not possible to precisely determine the set of string values that can reach a program point However one can compute over or under approximations of possible string values If the approximations are precise enough they can enable developers to demonstrate existence or absence of bugs in string manipulating code String analysis has been an active research area in the last decade resulting in a wide variety of string analysis techniques This book will primarily target researchers and professionals working in computer security software verification formal methods software engineering and program analysis Advanced level students or instructors
