Discrete Wavelet Transforms Dr. Awad Al-Asmari, 2013-02-06 Discrete Wavelet Transform is a wavelet DWT transform that is widely used in numerical and functional analysis Its key advantage over more traditional transforms such as the Fourier transform lies in its ability to offer temporal resolution i e it captures both frequency and location or time information This book presents a succinct compendium of some of the more recent variants of DWTs and their use to come up with solutions to an array of problems transcending the traditional application areas of image video processing and security to the relatively newer areas of medicine artificial intelligence power systems and telecommunications The first of the two sections of this book contains three chapters devoted to traditional applications of DWTs in digital image compression copyright protection and video resolution enhancement The second section comprising of five chapters is devoted to variants of the DWT and their applications in humanoid robot vision systems modeling and simulation recognition of physiological and behavioral traits through human gait and facial images assessment of agitation and sedation in intensive care patients maximization of power control systems and finally in demodulation of FM data in free space optical control systems

Wavelets, Approximation, and Statistical Applications Wolfgang Härdle, Gerard Kerkycharian, Dominique Picard, Alexander Tsybakov, 2012-12-06 The mathematical theory of ondelettes wavelets was developed by Yves Meyer and many collaborators about 10 years ago It was designed for ap proximation of possibly irregular functions and surfaces and

was successfully applied in data compression turbulence analysis image and signal processing Five years ago wavelet theory progressively appeared to be a powerful framework for nonparametric statistical problems Efficient computational implementations are beginning to surface in this second lustrum of the nineties This book brings together these three main streams of wavelet theory It presents the theory discusses approximations and gives a variety of statistical applications It is the aim of this text to introduce the novice in this field into the various aspects of wavelets Wavelets require a highly interactive computing interface We present therefore all applications with software code from an interactive statistical computing environment Readers interested in theory and construction of wavelets will find here in a condensed form results that are somewhat scattered around in the research literature A practitioner will be able to use wavelets via the available software code We hope therefore to address both theory and practice with this book and thus help to construct bridges between the different groups of scientists This text grew out of a French German cooperation Seminaire Paris Berlin Seminar Berlin Paris This seminar brings together theoretical and applied statisticians from Berlin and Paris This work originates in the first of these seminars organized in Garchy Burgundy in 1994

System Earth via Geodetic-Geophysical Space Techniques Frank M. Flechtner, Thomas Gruber, Andreas Güntner, M. Manda, Markus Rothacher, Tilo Schöne, Jens Wickert, 2010-07-10. Our planet is currently experiencing substantial changes due to natural phenomena and direct or indirect human interactions. Observations from space are the only means to monitor and quantify these changes on a global and long term perspective. Continuous time series of a large set of Earth system parameters are needed in order to better understand the processes causing these changes as well as their interactions. This knowledge is needed to build comprehensive Earth system models used for analysis and prediction of the changing Earth. Geodesy and geophysics contribute to the understanding of system Earth through the observation of global parameter sets in space and time such as tectonic motion, Earth surface deformation, sea level changes and gravity, magnetic and atmospheric fields. In the framework of the German geoscience research and development programme GEOTECHNOLOGIEN, research projects related to the theme 'Observing the Earth System from Space' have been funded within two consecutive phases since 2002, both covering 3 years. The projects address data analysis and model development using the satellite missions CHAMP, GRACE, GOCE and complementary ground or airborne observations. The results of the first phase projects have been published in the Springer book titled 'Observation of the Earth System from Space' edited by Flury, Rummel, Reigber, Rothacher, Boedecker and Schreiber in 2006. The present book titled 'System Earth via Geodetic-Geophysical Space Techniques' summarizes in 40 scientific papers the results of eight coordinated research projects funded in the second phase of this programme, 2005-2008.

Modeling Spatio-Temporal Data Marco A. R. Ferreira, 2024-11-29. Several important topics in spatial and spatio-temporal statistics developed in the last 15 years have not received enough attention in textbooks. 'Modeling Spatio-Temporal Data: Markov Random Fields, Objectives Bayes and Multiscale Models' aims to fill this gap by providing an overview of a variety of recently proposed approaches for the analysis of spatial and spatio-temporal datasets including proper Gaussian Markov random fields, dynamic multiscale spatio-temporal models and objective priors for spatial and spatio-temporal models.
