Non-Polysaccharide Plant Polymeric Materials José Alejandro

Heredia-Guerrero, Athanassia Athanassiou, 2016-05-17 Plants are the most important renewable source of feedstock for polymeric materials They are a resource of monomers and macromolecules after the appropriate chemical treatment By analogy with the petrochemistry industry plant macromolecules are depolymerized into simpler units which are generally chemically modified and re bound to produce new polymers The properties of these polymers are usually tailored by small chemical changes in their molecular structure or by the polymerization of plant monomers with other molecules Another interesting strategy for the formation of polymeric materials is the direct use of plant macromolecules in the form of blends composites grafted polymers multilayer systems etc The interactions and assemblies of the different components allow the control of the final features of such materials Traditionally polysaccharides with cellulose as the main protagonist have been the most used substances However as consequence of a growing demand of functional plastics other plant macromolecules

habitually considered wastes have started to become valuable raw materials Lignin and plant proteins mainly soy protein wheat gluten and zein are classical examples Also suberin has been highlighted in this field Other plant polymers such as the cutin and the sporopollenin are promising alternatives Furthermore other minority plant polymers e g cutan or algaenan could be potential sources of materials The different chemistry structure intrinsic properties and functions of these macromolecules in the plants are a strong inspiration for the development of novel and interesting polymeric materials Here in this Research Topic we welcome the submission of manuscripts related to the production extraction processability synthesis characterization and applications of non polysaccharides plant materials
