Answer Key

Enviro. Science 120

Pre Lab Work:

Before beginning this laboratory, answer the following questions on your own piece of paper in your notebook:

- Define the following terms:
 - growth rate – describes how fast a population is increasing or decreasing and is dependent upon the birth rate and death rate
 - birthrate – is the number of infants born in a given year/1000 people in the population
 - death rate – is the number of people who die in a given year/1000 individuals in the population
 - zero population growth – when the population is in equilibrium or the number of births and deaths are equal
 - developed country – countries that highly developed economy and advanced technology
 - developing country – countries that are considered to have low standard of living, and undeveloped industrially
 - demographic transition – refers to the transition from high birth and death rates to low birth and death rates
- What is a population explosion? How quickly is our population growing each year? What about each day?
A population explosion is when a population lacks limited resources so is able to grow out of control. The human population is grows about 80 million a year and 219, 178 each day.
- How is the growth rate of the human population calculated?
 $\text{Growth rate} = \text{birth rate} - \text{death rate}$
- What causes a negative population growth? What causes a positive population growth?
Negative population growth occurs when the birth rate is less than the death rate
Positive population growth occurs when the birth rate exceeds the death rate
- Why do the two graphs appear to have a different shape?
The population growth rate was much slower in the earlier years. The J-curve shows exponential population growth and the graphs are not drawn to the same scale.
- Using a piece of paper, create the following charts:

Country	Birthrate (%)	Death rate (%)	Population Growth 2005	Population Growth 2050	Demographic Transition	Relative Place in Transition	Sketch graph showing Blue & Pink Line
USA	2.06	0.51	0.92	-0.06	1.55	5

Nature-based solutions for climate change adaptation Andrea Ghermandi, Nalini Rao, Emma Ferranti, Petina Pert, 2025-11-10. Climate change poses complex challenges to the world in the form of extreme weather such as increased precipitation, droughts, flooding, and heat waves. These risks have significant impacts on ecosystems and communities which vary depending on their baseline vulnerability. These include risks to human life, human health, property, infrastructure, ecosystem health, and access to water and energy. Climate change adaptation becomes crucial in adjusting to life under these changing conditions. Some examples of adaptation include integrating robust and flexible operations, modifying infrastructure, managing the timing of engineering activities, capacity building, managing disaster risks, modifying ecosystem or community based approaches, strengthening stakeholders for decision making, designing new financing mechanisms, and using data driven methods to improve resilience. One important area of focus for climate adaptation is Nature based Solutions (NbS). Nature based Solution (NbS) refers to a suite of activities that integrate natural ecosystems and processes into various systems. The drivers for integration can include increasing efficiency, improving environmental impacts, creating multiple benefits, and reducing resource use, to name a few. NbS activities have been used to upgrade water systems, reduce heat island effects, improve stormwater management, green infrastructure building, and upgrading efforts, and provide multiple benefits to both ecosystems and communities. While NbS is not a novel concept, more research on the conceptual and technical aspects is needed to form a strong foundation from which applications can be designed. Research on the potential of NbS activities for specific climate change adaptation needs could unveil key insights in applicability, measurement, effectiveness, and scalability. The types of research needed to address climate change adaptation through NbS are very wide ranging. The presentation of conceptual frameworks and links between NbS and similar concepts including ecosystem services, ecosystem based

adaptation green infrastructure and passive treatment is important to articulate and clarify for use and integration in the climate adaptation context Evaluating the targeted implementation of NbS across landscapes coastal regions and watersheds as well as exploring its applicability in sectors like energy water forestry agriculture industry and the public sector are crucial areas of investigation Specific analysis of NbS designed to address critical risks such as floods droughts hurricanes and heatwaves could bring insights to different regions around the world Technical studies encompassing hydrology pollution control geospatial analysis environmental engineering and economics will offer essential guidance on where and how to implement NbS for climate change adaptation We invite researchers to explore and analyze the potential of Nature based Solutions NbS for Climate Change Adaptation We will consider a wide range of approaches from conceptual frameworks to analysis of technical solutions We encourage authors around the world to submit papers along the following themes Conceptual frameworks for NbS Examples of NbS in various ecosystem and regional contexts Comparative analysis of NbS and traditional solutions Advanced methods for modeling and estimating NbS outcomes Spatial and or temporal issues in NbS implementation monitoring and modeling Potential of Nbs in modifying infrastructure NbS applications to different sectors and scales e g urban and rural Scalability and replicability of NbS Lessons learned and NbS s risks for maladaptation Economic impacts financing and natural capital accounting and NbS Potential for self sustaining funding for NbS
