Synthetic Aperture Radar Polarimetry Jakob J. van Zyl, 2011-10-14 This book describes the application of polarimetric synthetic aperture radar to earth remote sensing based on research at the NASA Jet Propulsion Laboratory JPL This book synthesizes all current research to provide practical information for both the newcomer and the expert in radar polarimetry The text offers a concise description of the mathematical fundamentals illustrated with many examples using SAR data with a main focus on remote sensing of the earth

The book begins with basics of synthetic aperture radar to provide the basis for understanding how polarimetric SAR images are formed and gives an introduction to the fundamentals of radar polarimetry. It goes on to discuss more advanced polarimetric concepts that allow one to infer more information about the terrain being imaged. In order to analyze data quantitatively the signals must be calibrated carefully which the book addresses in a chapter summarizing the basic calibration algorithms. The book concludes with examples of applying polarimetric analysis to scattering from rough surfaces to infer soil moisture from radar signals.

MATLAB Simulations for Radar Systems Design Bassem R. Mahafza, Atef Elsherbeni, 2003-12-17 Simulation is integral to the successful design of modern radar systems and there is arguably no better software for this purpose than MATLAB. But software and the ability to use it does not guarantee success. One must also understand radar operations and design philosophy. Know how to select the radar parameters to meet the design requirements.

Radar Polarimetry Siow Yin Yong, 2004-12 Radar polarimetry is a recent development seeing active research only in the last few decades. The phenomenon that optimal maximal power reflected fields exist in both the co-polarized and cross-polarized channels of the receiving radar antenna was first introduced by Kennaugh and Huynen. Current research efforts focus on target scattering matrices and relating them to physical attributes of the target. This thesis provides a comprehensive survey of the polarimetry theories that have been put forth by various researchers to characterize, manipulate and optimize target radar returns via polarization states. One such theory is the Target Decomposition (TD) theorem that seeks to decompose the target returns into individual scattering mechanisms. The topic of optimization of polarization states of the incident field for maximizing power return is also examined. Two models are implemented in Matlab to verify and demonstrate these polarimetry theories. The first model uses TD theorems to simulate foliage clutter and study its effect on the polarization of the incident electric field. A simulated static dihedral target is introduced and its effect on wave polarization is also simulated. The second model studies optimization of polarization states. Both models are able to produce the expected results for known canonical targets.
